

Technical manual

## NS FREE COOLING GLYCOL FREE

- CHILLER COOLING ONLY
- EXTERNAL UNIT
- HIGH EFFICIENCY
- SCREW COMPRESSOR

EN

Dear Customer,

Thank you for choosing an AERMEC product. This product is the result of many years of experience and in-depth engineering research, and it is built using top quality materials and advanced technologies.

In addition, the CE mark guarantees that our appliances fully comply with the requirements of the European Machinery Directive in terms of safety. We constantly monitor the quality level of our products, and as a result they are synonymous with Safety, Quality, and Reliability.

*Product data may be subject to modifications deemed necessary for improving the product without the obligation to give prior notice.*

Thank you again.  
AERMEC S.p.A

# NS FREECOOLING GLYCOL FREE

SERIAL NUMBER	
---------------	--

**DECLARATION OF CONFORMITY**

We, the undersigned, hereby declare under our own responsibility that the assembly in question, defined as follows:

**NAME** NS FREE COOLING GLYCOL FREE

**TYPE** AIR - WATER CHILLER

**MODEL**

To which this declaration refers, complies with the following harmonised standards:

IEC EN 60335-2-40	Safety standard regarding electrical heat pumps, air conditioners and dehumidifiers.
IEC EN 61000-6-1 IEC EN 61000-6-3	Immunity and electromagnetic emissions for residential environments.
IEC EN 61000-6-2 IEC EN 61000-6-4	Immunity and electromagnetic emissions for industrial environments.
EN378	Refrigerating system and heat pumps - Safety and environmental requirements.
UNI EN 12735 UNI EN 14276	Seamless, round copper tubes for air conditioning and refrigeration. Pressure equipment for cooling systems and heat pumps.

Thereby, compliant with the essential requirements of the following directives:

- LVD Directive: 2006/95/CE
- Electromagnetic Compatibility Directive 2004/108/CE
- Machinery Directive 2006/42/CE
- PED Directive regarding pressurised devices 97/23/CE

The product, in agreement with Directive 97/23/CE, satisfies the Total quality Guarantee procedure (form H) with certificate no. 06/270-QT3664 Rev. 5 issued by the notified body n.1131 CEC via Pisacane 46 Legnano (MI) - Italy

The person authorised to constitute the technical file is: Massimiliano Sfragara - 37040 Bevilacqua (VR) Italy - Rome, 996

Bevilacqua

Marketing Manager  
Signature

Standards and Directives respected when designing and constructing the unit:

**Safety:**

**Machinery Directive**  
2006/42/CE

**Low Voltage Directive**  
LVD 2006/95/CE

**Electromagnetic Compatibility Directive**

EMC 2004/108/EC

**Pressure Equipment Directive**

PED 97/23/CE EN 378,  
UNI EN 14276

**Electric part:**

EN 60204-1

**Protection rating**

IP24

**Acoustic part:**

SOUND POWER

(EN ISO 9614-2)

SOUND PRESSURE

(EN ISO 3744)

**Refrigerant GAS:** R134a

This unit contains fluoride gases with greenhouse effect covered by the Kyoto Protocol. Maintenance and disposal must only be performed by qualified staff.

GWP=1900

## 1. GENERAL WARNINGS

AERMEC NS FREECOOLING GLYCOL FREE units are constructed according to the recognised technical standards and safety regulations. They have been designed and must be used for air conditioning purposes, in accordance with their technical features. Any contractual or extracontractual liability of the Company is excluded for injury/damage to persons, animals or objects owing to installation, regulation and maintenance errors or improper use. All uses not expressly indicated in this manual are prohibited.

### 1.1. PRESERVATION OF THE DOCUMENTATION

The instructions along with all the related documentation must be given to the user of the system, who assumes the responsibility to conserve the instructions so that they are always at hand in case of need.

Read this sheet carefully; the execution of all works must be performed by qualified staff, according to Standards in force on this subject in different countries.

The appliance must be installed in such a way as to enable maintenance and/or repairs to be carried out.

The appliance warranty does not cover the costs for ladders, scaffolding, or other elevation systems that may become necessary for carrying out servicing under warranty.

Do not modify or tamper with the chiller as dangerous situations can be created and the manufacturer will not be liable for any damage caused. The validity of the warranty shall be void in the event of failure to comply with the above-mentioned indications.

## 1.2. WARNINGS REGARDING SAFETY AND INSTALLATION STANDARDS

- The cooler must be installed by a qualified and suitably trained technician, in compliance with the national legislation in force in the country of destination.  
**⚠ AERMEC will not assume any responsibility for damage due to failure to follow these instructions.**
- Before beginning any operation, READ THESE INSTRUCTIONS CAREFULLY AND CARRY OUT THE SAFETY CHECKS TO AVOID ALL RISKS. All the staff involved must have thorough knowledge of the operations and any dangers that may arise at the moment in which the installation operations are carried out.

## 2. IDENTIFICATION OF THE PRODUCT

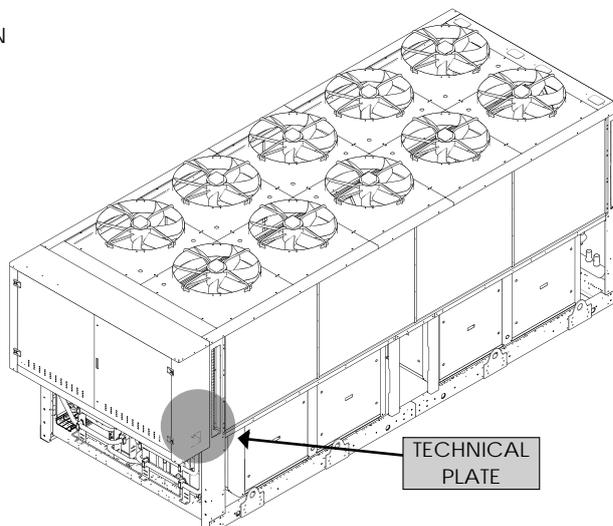

The NS-FREECOOLING GLYCOL FREE units can be identified by the following:

- PACKING LABEL  
which shows the product identification data
- TECHNICAL PLATE  
Positioned on the right lateral side-member (see fig.1)

### **⚠ ATTENTION**

*Tampering, removal, lack of the identification plate or other does not allow the safe identification of the product and will make any installation or maintenance operation to be performed difficult.*

TECHNICAL PLATE POSITION

**⚠ ATTENTION:**

The drawings are merely indicative.

Fig.1

### 3. PRESENTATION

Water-cooled high efficiency air chillers for **outdoor installation**.

The units have **semi-hermetic screw compressors**, optimised for the use of the R134a refrigerant.

The **high unit efficiency axial fans** are regulated to optimise the air flow rates to the condensing coils.

The **air condensing coils** made with copper pipes and aluminium louvered fins are optimised for better heat exchange performance.

**Water condensing coils** used in free cooling operation. They are factory-tested with pressurised air.

#### Shell and tube heat evaporator

Direct expansion type, suitably dimensioned to obtain high performance.

The NS FREECOOLING units are supplied with refrigerant load and oil, factory-inspected and only require electric and hydraulic connections in the place of installation.

#### 3.1. HIGH EFFICIENCY

Thanks to the technology applied, the use of the dedicated compressors and heat exchangers with high heat exchange co-efficients, allow to reach high EER values in the work conditions declared by Eurovent thereby guaranteeing lower working costs and consequently quicker return of the investment.

#### 3.2. SILENCE

Guaranteed by the integral bonnet of the compressors and by the DCPX DEVICE, standard for all versions.

Versions E also have a **muffler** installed on the compressor flow line Possibility of lowering noise even further using the **AKW accessory**, only available in the silenced versions (E).

#### 3.3. MODELS

##### Free Cooling Glycol free (B) NS FREE COOLING GLYCOL FREE

appliances are water chillers equipped with a recovery system of the cooling capacity of outdoor air called "free cooling".

This free water cooling system (thus the name freecooling) consists in integrating, and eventually fully replacing, the cooling capacity supplied by the compressors by using an additional water coil which exploits

the low-temperature of outdoor air to cool water returning from the system. The use of an intermediate plate heat exchanger obtains two circuits:  
- glycoled hydraulic circuit, with glycol added to protect the coils from freezing;

- system side hydraulic circuit, glycol free, providing greater yield.

This system makes it possible to obtain cooled water almost free of charge for all those installations where its production is required constantly and therefore also with low outdoor air temperatures, for example industrial processes, shopping centres, hospitals and other civil applications.

This solution provides considerable energy-saving (see chapter functioning layout NS FREECOOLING GLYCOL FREE).

#### FUNCTIONING MODE:

##### – FREE-COOLING ONLY:

when the outdoor temperature is sufficiently low to cool the water in the free-cooling coils until the design temperature. This condition is the most economical as only the fans operate in speed modulation.

##### – FREE-COOLING + COMPRESSORS:

when the cooling capacity recovered from the outdoor air is no longer sufficient to satisfy the system demand, the compressors work in free-cooling integration.

The greater the cooling capacity recovery with free-cooling, the less this integration will be.

##### – COMPRESSORS ONLY:

when the outdoor air is warmer than the water returning from the system.

#### 3.4. VERSIONS

- High efficiency [A]
- Silenced high efficiency (E)

##### • Extended operational limits

**Max. summer outdoor air temperature:**

**42°C for models 1601 and 3002 to 3402**

**44°C for models 5002 to 5702**

**46°C for all other models**

#### ⚠ ATTENTION

*Possibility of exceeding the limits with reduced power, thanks to an intelligent algorithm that prevents blockage in extreme situations.*

*If the unit is to function beyond the operational limits, we recommend you first contact our technical-sales service*

#### 3.5. FANS

- STANDARD (°)
- INCREASED (M)
- INVERTER (J)

#### ⚠ ATTENTION

*The machines with an inverter fan require a Class B residual current device as protection (motor leakage current <3.5mA).*

#### 3.6. HEAT RECUPERATORS:

- Without recuperators °
- Desuperheater D: Unit with (AISI 316) heat plate, insulated externally with closed cell material to reduce heat loss.

#### 3.7. HYDRONIC KIT

##### Without pumps (00)

##### Single pump

(PA - PC - PE - PG - PJ)

Provides, depending on the features of the pump chosen, a useful static pressure to overcome system pressure drops.

##### Single pump and reserve pump

(PB - PD - PF - PH - PK)

In the presence of the second pump (reserve), changeover is performed manually by acting on the selector inside the electric control board, or else on the one outside the board.

### Limitations of option D with Desuperheater

not available for sizes:

- from 1251 up to 1601
- 1402 e 1602
- from 2002 up to 3402

Possible for sizes

- 1801, 1802
- from 3002 up to 4202
- from 6003 up to 6603

without evaporator side pumping unit

### Limitations of option Power supply

\* not available for sizes:

from 1251 up to 2401 and from 2352 up to 7203

\*\* not available for sizes:

from 1801 up to 2401 and from 3402 up to 7203

### Limitations of option Hydronic kit

not available for size:

- **1402, 1602, 2002**

not available PB, PD, PF, PH, PK for size:

- from 1251 up to 1601
- from 3002 up to 3402

## 9. DESCRIPTION OF COMPONENTS

### 9.1. STRUCTURE

#### Base and support structure

Made up from hot galvanised sheet steel profiles with suitable thickness. Polyester powder painting (RAL 9002), resistant to atmospheric agents. Realised in a way to allow total accessibility to the components inside, for service and maintenance operations.

#### Acoustic protection cover

As per standard, all **NS FREECOOLING** versions consist in a thick galvanised steel compartment and a sound-absorbent lining. This reduces the sound power level emitted by the unit and also protects the compressors from atmospheric agents.

### 9.2. FANS

#### Ventilation Unit

Helical type with IP54 protection rating and balanced statically and dynamically. The electric fans are protected electrically by magnet-circuit breakers and mechanically by anti-intrusion metal grids, according to the IEC EN 60335-2-40 Standard.

#### ⚠ ATTENTION

*The machines with an inverter fan require a Class B residual current device as protection (motor leakage current <3.5mA)*

#### DCPX: as per standard with all versions

This device allows correct functioning with external temperatures lower than 10 °C and as low as - 10 °C. It is made up from an adjustment circuit board that varies the number of fan revs on the basis of the condensation pressure, read by the high pressure transducer, in order to keep it sufficiently high for correct unit functioning.

### 9.3. COOLING CIRCUIT

#### Compressor/s

High efficiency semi-hermetic screw compressors with adjustment of the cooling capacity via continuous modulation from 40 to 100% with mechanical thermostatic valve and from 25 to 100% with an electronic valve and equipped with:

- Motor circuit breaker protection
- Oil discharge temperature control
- Electric resistance for heating the oil sump with compressor at a standstill
- Reset button
- Oil level

#### Evaporator (shell and tube exchanger)

Dry expansion type, suitably dimensioned to obtain high performance. A steel case with closed cell expanded elastomer anti-condensation covering. The shell and tube is made from copper pipes with a special profile that allows high

exchange and low pressure drops.

An electric anti-freeze resistance is supplied as per standard, which protects the heat exchanger from external temperatures as low as -20°C, to prevent ice from forming in stand-by mode.

With the unit running, the protection is ensured by the output water temperature probe and the differential pressure switch.

#### Condensing coils (air exchanger)

made with copper pipes and aluminium louvered fins blocked by mechanical expansion of the pipes. IT IS THE high-efficiency type.

#### Liquid and pressing line taps

Interrupt the refrigerant in case of maintenance

#### Liquid indicator

Used to check the refrigerant gas load and the possible presence of humidity in the cooling circuit.

#### Dehydrator filter

Mechanical with cartridge made of ceramics and hygroscopic material, able to withhold impurities and any traces of humidity present in the cooling circuit.

#### Thermostatic valve

Mechanical valve, with external equaliser positioned at evaporator outlet, modulates the flow of gas to the evaporator, depending on the heat load, in order to ensure a correct heating level of the intake gas.

#### Electronic thermostatic valve

(option with configurator)

#### ⚠ ATTENTION

*(THE electronic thermostatic valve is mounted as per standard for sizes from 5002 to 5702)*

In comparison with the classic thermostatic valve, the electronic thermostatic valve, equipped with an indicator to monitor the stopper and the flow of refrigerant inside the circuit, is distinguished for better overheating regulation, and full use is made of the evaporator in all conditions, thereby increasing machine efficiency and achieving machine stability quicker and maintaining this constant.

**Muffler:** device mounted on the pressing line to reduce the noise produced when the high pressure gas passes through. IT IS mounted as per standard on silenced versions (E)

#### Solenoid valve

The valve closes when the compressor switches off, blocking the flow of refrigerant gas to the evaporator. (not supplied with Electronic thermostatic valve)

#### One-way valve

Allows one-way flow of the refrigerant.

### 9.4. HYDRAULIC CIRCUIT

The 00 version includes as per standard:

- Evaporator (shell and tube heat exchanger) supplied with stub pipe and victaulic connections
- Differential pressure switch
- Air vent valve
- SIW water inlet probe
- SUW water outlet probe
- Inlet water filter

The glycoled hydraulic circuit includes as standard:

- Intermediate plate heat exchanger
- Circulation pump
- Expansion vessel
- Flow switch
- Minimum pressure switch
- Manometer
- Safety valve

In the system side circuit anti-freeze heaters are installed on water pipings as standard so that the temperature will not reach the anti-freeze limit

#### Water coils (free cooling water exchanger)

made with copper pipes and aluminium louvered fins blocked by mechanical expansion of the pipes. IT IS THE high-efficiency type.

The Water coils are inspected in the factory with pressurised air.

#### Intermediate plate heat exchanger

Unit with (AISI 316) heat plate, insulated externally with closed cell material to reduce heat loss. Supplied with an anti-freeze electric resistance as per standard.

#### Glycoled hydraulic circuit circulation pump

Mounted on the glycoled hydraulic circuit, it switches on to circulate water inside the intermediate heat exchanger and free cooling coils providing heat exchange with external air.

#### ⚠ ATTENTION

*SUW - COMMON OUTLET WATER SENSOR (in units with over an evaporator)*

*Pay attention to fit the water sensor on the evaporators, first providing a ½-inch sleeve. The water sensor must be fitted on the best position to measure the right mixing water temperature of the system.*

#### Electrical Box

SUW - COMMON OUTLET WATER SENSOR

#### Circulation pump

(option with configurator)

Provides, depending on the features of the pump chosen, a useful static pressure to overcome system pressure drops.

In the presence of the second pump (reserve), changeover is performed manually by acting on the selector inside the electric control board, or else on the one outside the board.

## 2 EXPANSION VESSELS

*(only in versions with pump)*

With 25 l nitrogen pre-load membrane

## VERSION WITH DESUPERHEATER

*(option with configurator)*

Unit with (AISI 316) heat plate, insulated externally with closed cell material to reduce heat loss.

## 9.6. CONTROL AND SAFETY COMPONENTS

### COOLING CIRCUIT

#### High Pressure Switch (standard)

With fixed calibration, placed on high pressure side of cooling circuit, inhibits functioning of compressor if abnormal work pressure occurs.

#### Double high pressure switch (manual + tool - standard supply)

Calibrated in the factory, placed on the high pressure side of the cooling circuit, it inhibits the functioning of the unit if abnormal work pressure occurs.

#### High Pressure Transducer (standard)

Placed on high pressure side of cooling circuit, signals the work pressure to control board, generating a pre-warning in case abnormal pressure occurs.

#### Low pressure transducer (standard)

Allows to view the value of the compressor intake pressure on the microprocessor board display (one per circuit). Placed on the low pressure side of the cooling circuit.

### Cooling circuit safety valves (High Pressure / Low Pressure)

Calibrated at 22 bar HP - 16.5 LP, they intervene by discharging the overpressure in the case of anomalous pressures.

### Fuses or magnet circuit breakers

They protect the compressors (to be specified when placing the order).

### HYDRAULIC CIRCUIT

#### Differential pressure switch IP54 n°1 for circuit (standard supply)

Positioned between the evaporator inlet and outlet, it has the task of controlling that there is water circulation. If this is not the case it blocks the unit.

#### Safety valve (calibrated 6 bar)

Equipped with a piped discharger, intervenes by discharging the over pressure in case of anomalous pressures.

## 9.5. ELECTRIC CONTROL BOARD AND REGULATION

### ELECTRIC CONTROL BOARD

Contains the power section and control and safety device management and complies with standards IEC 60204-1, and electromagnetic compatibility directive EMC 89/336/EEC and 92/31/EEC

### DOOR-LOCK ISOLATING SWITCH

The electric control board can be accessed by removing the voltage. Act on the opening lever of the control board itself.

This lever can be locked using one or more padlocks during maintenance interventions to prevent the machine being powered up accidentally.

### CONTROL BOARD

Allows the complete control of the appliance

For a more in-depth description please refer to the user manual.

### ELECTRONIC REGULATION

The electronic control on NS FREE COOLING chillers is made up of a control board for every compressor connected to each other in a network and a control panel with display. For multi-compressor models, the board controlling compressor n°1 is the "MASTER" board, while the others are

"SLAVE". The transducers, loads and alarms relative to the compressor that controls are connected to every board, while only the general machine ones are connected to the master board.

### Microprocessor

- Remote on/off with voltage-free external contact.
- Multi-language menu
- Phase sequence control
- Separate control of the individual compressors
- Amperometric transformer
- Cumulative faults block signal
- Alarm log function
- Daily/weekly programming
- Inlet/outlet water temperature display
- Alarms display
- Integral proportional regulation on outlet water temperature
- Programmable timer function
- Function with double calibration point linked to an external contact
- Fan adjustment
- Can be interfaced with Modbus protocol (accessory)
- Pump/s control
- Compressors rotation management
- Analogue input from 4 to 20 mA
- External air temperature probe
- "Always Working" function In the

## 9.7. WATER FEATURES

PH	6-8
Electric conductivity	less than 200 mV/cm (25°C)
Chloride ions	less than 50 ppm
Sulphuric acid ions	less than 50 ppm
Total iron	less than 0.3 ppm
Alkalinity M	less than 50 ppm
Total hardness	less than 50 ppm
Sulphur ions	none
ammonia ions	none
Silicone ions	less than 30 ppm

### Vent valve (as per standard in all versions)

Automatic-type valve mounted on the top of the hydraulic system; they discharge possible air pockets.

### Water filter (mounted as per standard)

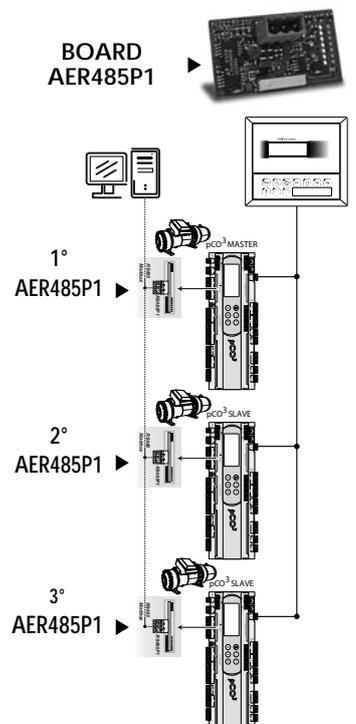

This allows to block and eliminate any impurities present in the hydraulic circuits. It contains a filtering mesh with holes that do not exceed one millimetre. It is indispensable in order to prevent serious damage to the plate exchanger.

### Flow switch (mounted as per standard on glycoled hydraulic circuit)

It has the task of controlling that there is water circulation inside the heat exchangers; if this is not the case, it blocks the unit.

### Fans magnet-circuit breakers protection

### Auxiliary magnet circuit-breaker protection

**ATTENTION**  
All cables inside the control board are numbered for immediate recognition of all electric components.

case of critical conditions (e.g. an environmental temperature that is too high) the machine does not stop but can adjust itself and supply the maximum power in those conditions

- Self-adapting "Switching Hysteresis" work differential to always ensure the correct functioning times of the compressors even in plants with low

water content or insufficient flow rates. This system decreases compressor wear

- AFFP "Anti-Freezing Fan Protection" system that periodically switches the fans on when external temperatures are very low.

- PDC "Pull Down Control" system to prevent the activation of power steps when the water temperature quickly

approaches the set-point. Optimises machine functioning when working normally and in the presence of load variations, ensuring the best machine efficiency in all conditions.

**ATTENTION**

For further information concerning electronic adjustments, please refer to the user manual.

## 10. DESCRIPTION OF ACCESSORIES

### - ELECTRIC REGULATION ACCESSORIES

**AER485P1:** This accessory allows connection of the unit to BMS supervising systems with RS 485 electric standard and MODBUS protocol.

**NOTE: n°1 must be envisioned per compressor.**

**AERWEB300:** AERWEB device allows remote control of a chiller from a common PC via a serial connection. By using additional modules, the device allows control of the chiller via a telephone network when the AERMODEM accessory is used or via a GSM network when the AERMODEMGSM accessory is used. **The AERWEB can pilot up to 9 chillers, each of which must be equipped with the AER485P1 accessory.**

**MULTICHILLER:** Control, switch-on and switch-off system of the single chillers where multiple units are installed in parallel.

**PRV3:** Allows to control the chiller at a distance.

### - ELECTRIC ACCESSORIES

**RIFNSFREECOOLING:** Current rephaser. Connected in parallel to the compressor, it allows a reduction of the input current (approx. 10%). It can only be installed in the factory and so must be requested when ordering.

**KRS (obligatory accessories):** Electrical evaporator resistor for external temperatures up to -10 °C.

**KRSDES (obligatory accessories):** kit consisting of an electric resistance mounted in the evaporator and one mounted in the desuperheater. *(KRS and KRSDES accessories can only be applied in the factory)*

- **KDI:** 20 mm dual-lined evaporator, allows to leave the unit in standby with temperatures as low as -20°C. It must be requested when placing the order combining it with the KRS and KRSDES electric resistance.

### - GENERIC ACCESSORIES

#### GP (PROTECTION GRIDS)

*(To be mounted in the factory)*

Protects the external coil from blows and prevents access to the underlying area where the compressors and the chiller circuit are housed.

#### AK (ACOUSTIC PROTECTION KIT)

*(To be mounted in the factory)*

This accessory reduces the noise further by means of a compressor cover, optimised with high density material without lead that reduces vibrations even further.

#### AVX (Spring anti-vibration mounts)

In order to reduce the vibrations transmitted to the support structure of the unit, mount anti-vibration supports on each resting point.

### 14. OPERATING LIMITS

#### COOLING MODE

For functioning limits, please refer to the diagram, valid for  $\Delta t = 5^\circ\text{C}$ .

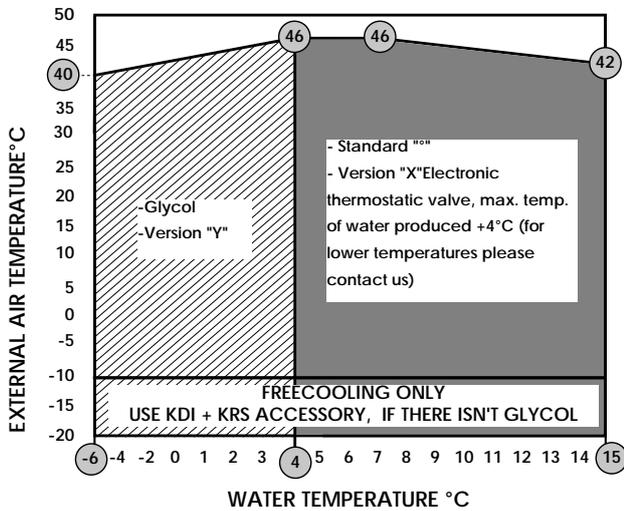

#### ⚠ ATTENTION

The units, in standard configuration, are not suitable for installation in salty environments.

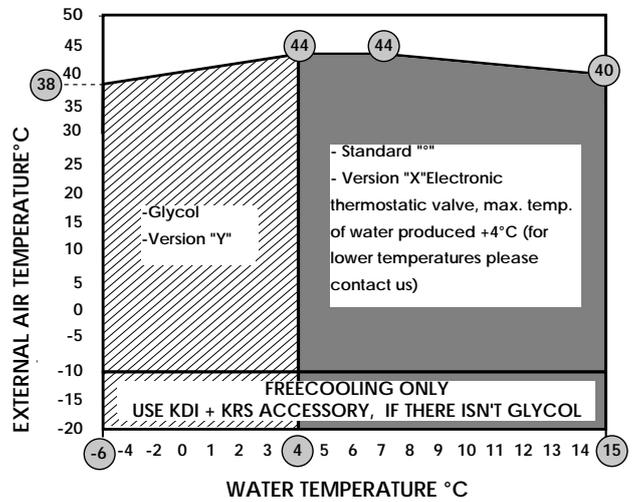

If the unit is to function beyond the operational limits, we recommend you first contact our technical-sales service

When the unit is installed in particularly windy areas, we recommend installing wind barriers if wind speed exceeds 2.5 m/s

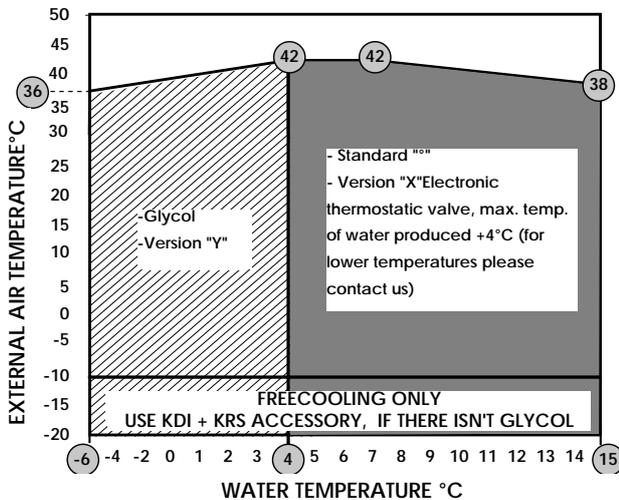

OPERATING LIMITS NS FREECOOLING GLYCOL FREE

OPERATING LIMITS NS FREECOOLING GLYCOL FREE 5002,5202,5402,5702

OPERATING LIMITS NS FREECOOLING GLYCOL FREE 1601-3002-3202-3402

## 15. CORRECTIVE COEFFICIENTS

### 15.1. NS-FREECOOLING HIGH-EFFICIENCY VERSION

### 15.2. NS-FREECOOLING HIGH-EFFICIENCY SILENCED VERSION

#### Key

$P_c$  = Cooling capacity

$P_e$  = Input power

$C_a$  = Corrective coefficients of absorbed power ( $P_e$ )

$C_e$  = Corrective coefficients of cooling capacity ( $P_c$ )

- Y Mechanical thermostatic valve produced water temperature from +4°C to -6°C
- X Electronic thermostatic valve produced water temperature up to +4°C (contact head office for lower temperatures)

The cooling capacity efficiency and electrical input power in conditions differing from normal conditions are obtained by multiplying the nominal values ( $P_c$ ,  $P_e$ ) by the respective coefficient correctives ( $C_f$ ,  $C_a$ ).

The following diagrams show how to obtain corrective coefficients to use for units in their various versions in cooling mode; external air temperature, to which reference is made, is shown in correspondence to each curve.

#### Nominal reference conditions:

##### COOLING

Inlet water temperature	12°C
Outlet water temperature	7°C
External air temperature	35°C
$\Delta t$	5°C

### 15.3. FOR $\Delta t$ DIFFERENT FROM THE NOMINAL

The performances provided in the technical data refer to  $\Delta t$  5°C. Use the table below to obtain the corrective factors of a cooling capacity and input power other than  $\Delta t$  5°C.

#### Corrective coeff. for $\Delta t$ different from the nominal value ( $\Delta t=5^\circ\text{C}$ )

Heat drop value $\Delta t$	3	5	8	10
Cooling capacity correction factors	0,99	1	1,02	1,03
Input power correction factors	0,99	1	1,01	1,02

### 15.4. FOR DEPOSIT FACTORS DIFFERENT FROM THE NOMINAL

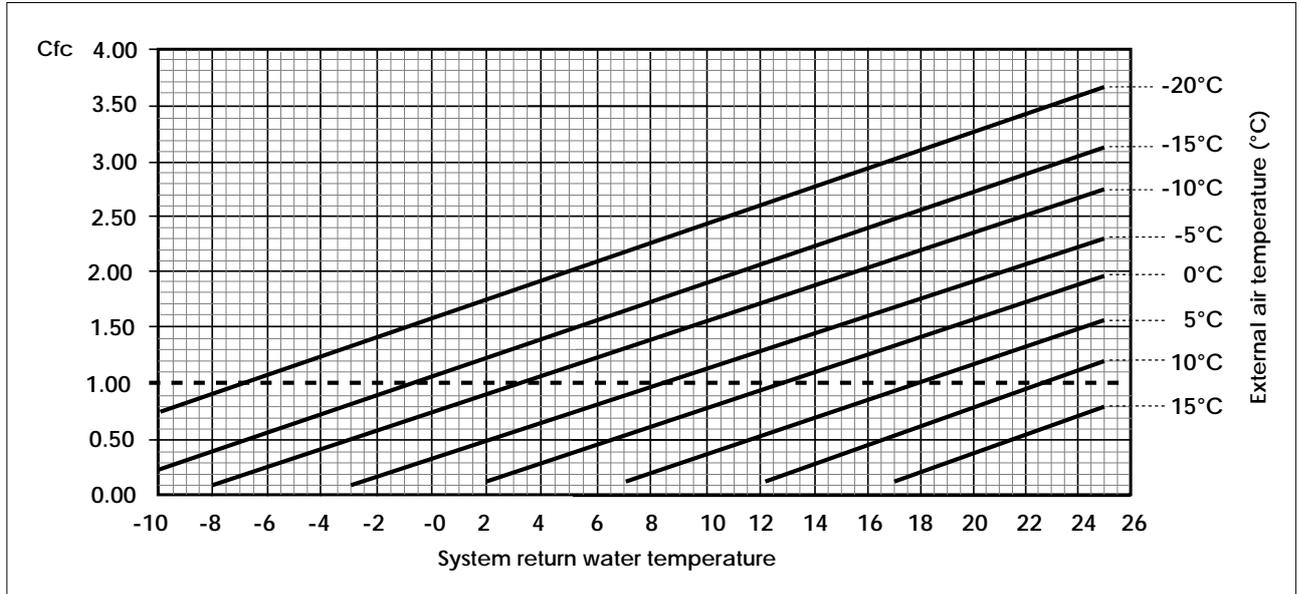

The performances provided in the technical data refer to clean tubes with deposit factor=1. For different deposit factor values, multiply the performance data in the table by the coefficients shown.

#### Corrective coeff. for deposit factors different from the nominal value (0.00005)

Deposit factor [ $\text{K}^2\text{m}^2$ ]/[W]	0,00005	0,0001	0,0002
Cooling capacity correction factors	1	0,98	0,94
Input power correction factors	1	0,98	0,95

15.5. NS-FREECOOLING VERSION FREE COOLING ONLY

Free-Cooling mode

**Key**

*Pfc*= Cooling capacity

*Pe*=Input power

*Ca* = Corrective coefficients of absorbed power (*Pe*)

*Cfc* = Corrective coefficients of cooling capacity (*Pfc*)

The maximum cooling capacity when working in free-cooling mode only, namely with the compressors off, is achieved by multiplying the nominal free-cooling cooling capacity value (*Pc*) reported in the technical data by the respective corrective coefficient (*Cfc*) which is obtained from the following diagram based on the produced water temperature and the external air temperature.

These values refer to full speed fans (maximum absorbed power); if the power output is in excess speed will be modulated.

**Nominal reference conditions:**

*Free cooling*

Inlet water temperature 15°C

External air temperature 2°C

Glycol 0%

Glycol primary circuit 30%

15.6. FOR ΔT DIFFERENT FROM THE NOMINAL

The performances provided in the technical data refer to Δt 5°C. Use the table below to obtain the corrective factors of a cooling capacity and input power other than Δt 5°C.

**Corrective coeff. for Δt different from the nominal value (Δt=5°C)**

Heat drop value Δt	3	5	8	10
Cooling capacity correction factors	0,99	1	1,02	1,03
Input power correction factors	0,99	1	1,01	1,02

15.7. FOR DEPOSIT FACTORS DIFFERENT FROM THE NOMINAL

The performances provided in the technical data refer to clean tubes with deposit factor=1.

For different deposit factor values, multiply the performance data in the table by the coefficients shown.

**Corrective coeff. for deposit factors different from the nominal value (0.00005)**

Deposit factor[K*m²]/[W]	0,00005	0,0001	0,0002
Cooling capacity correction factors	1	0,98	0,94
Input power correction factors	1	0,98	0,95

## 16. GLYCOL

- The corrective factors of cooling capacity and input power take into account the presence of glycol and the difference in evaporation temperatures.
- The pressure drop correction factor considers the different flow rate resulting from the application of the water flow rate correction factor.
- The water flow rate correction factor is calculated to keep the same  $\Delta t$  that would be present with the absence of glycol.

### NOTE

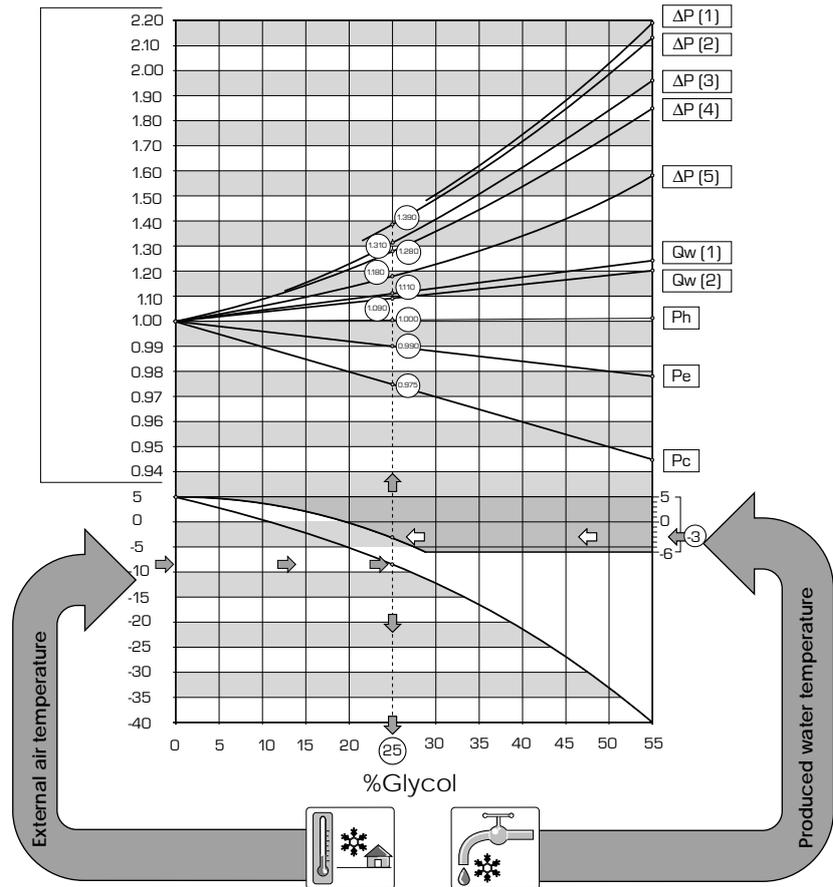

On the following page an example is given to help graph reading. to determine the percentage of glycol required, see diagram below; this percentage calculation can take into consideration one of the following factors:

Depending on which fluid is considered (water or air), the graph is interpreted by the right or left side at the crossing point on the curves with the external temperature line or the water produced line. A point from which the vertical line will pass is obtained and this will distinguish both glycol percentage and relative correction coefficients.

### 16.1. HOW TO INTERPRET GLYCOL CURVES

The curves shown in the diagram summarise a significant number of data, each of which is represented by a specific curve. In order to use these curves correctly it is first necessary to make some initial reflections.

- If you wish to calculate the percentage of glycol on the basis of the external air temperature, enter from the left axis and on reaching the curve draw a vertical line, which in turn will intercept all the other curves; the points obtained from the upper curves represent the coefficients for the correction of the cooling capacity and input power, the flow rates and the pressure drops (remember that these coefficients must be multiplied by the nominal value of the size in question); while the glycol percentage value recommended to produce desired water temperature is on the lower axis.
- If you wish to calculate the percentage of glycol on the basis

### KEY:

- Pc Corrective factors for cooling capacity
- Pe Corrective factors of the input power
- $\Delta P$  (1) Corrective factor for pressure drops with an average fluid temp. = -3.5 °C
- $\Delta P$  (2) Corrective factor for pressure drops with an average fluid temp. = 0.5 °C
- $\Delta P$  (3) Corrective factor for pressure drops with an average fluid temp. = 5.5 °C
- $\Delta P$  (4) Corrective factor for pressure drops with an average fluid temp. = 9.5 °C
- $\Delta P$  (5) Corrective factor for pressure drops with an average fluid temp. = 47.5 °C
- Qw (1) Corrective factor for pressure drops (evap) with an average fluid temp. = 9.5 °C
- Qw (2) Corrective factor of flow rates (condenser) with an average fluid temp. = 47.5 °C

### NOTE

Although the graph shows a max external air temperature of -40°C, the unit operational limits must be complied with.

of the temperature of the water produced, enter from the right axis and on reaching the curve draw a vertical line, which in turn will intercept all the other curves; the points obtained from the upper curves represent the coefficients for the correction of the cooling capacity and input power, the flow rates and the pressure drops (remember that these coefficients must be multiplied by the nominal value of the size in question); while the lower axis recommends the glycol percentage value

necessary to produce water at the desired temperature.

- Initial rates for "EXTERNAL AIR TEMPERATURE" and "TEMPERATURE OF PRODUCED WATER", are not directly related, therefore it is not possible to refer to the curve of one of these rates to obtain corresponding point on the curve of the other rate.

## 17. CIRCUIT PRESSURE DROPS

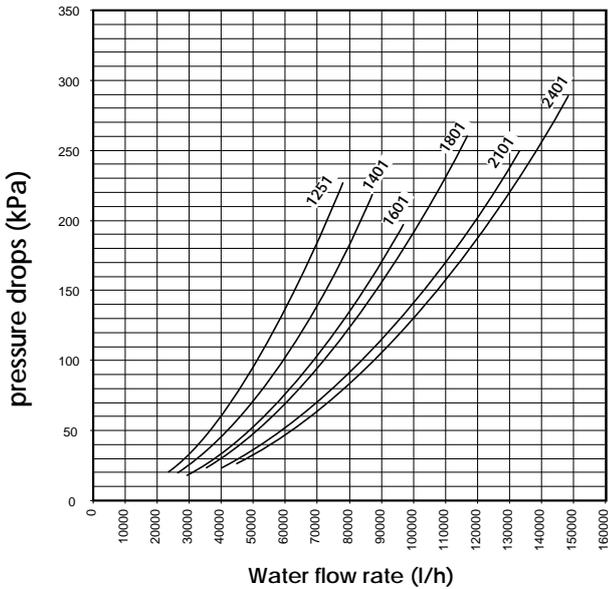

### 17.1. VERSION WITHOUT PUMPS (00)

The pressure drops in the diagram are relative to an average water temperature of 10 °C.  
The table states the correction to apply to the pressure drops on variation of the average water temperature.

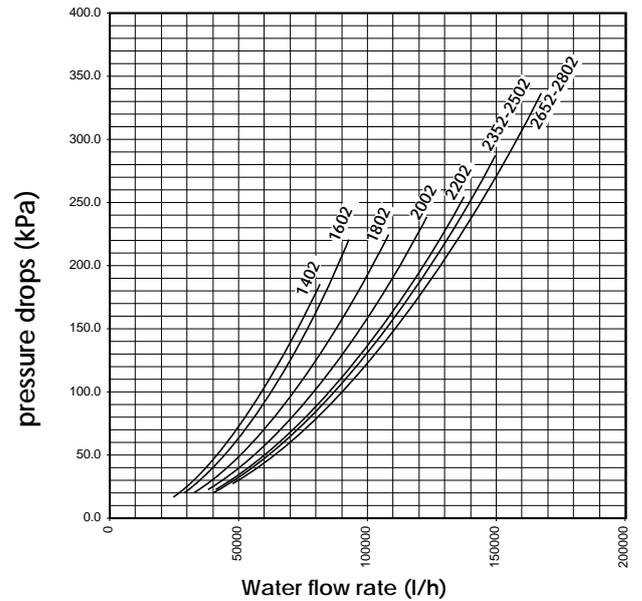

**Nominal reference conditions:**

- Water inlet temperature 12 °C
- Produced water temperature 7 °C
- External air temperature 35 °C
- $\Delta t$  5k

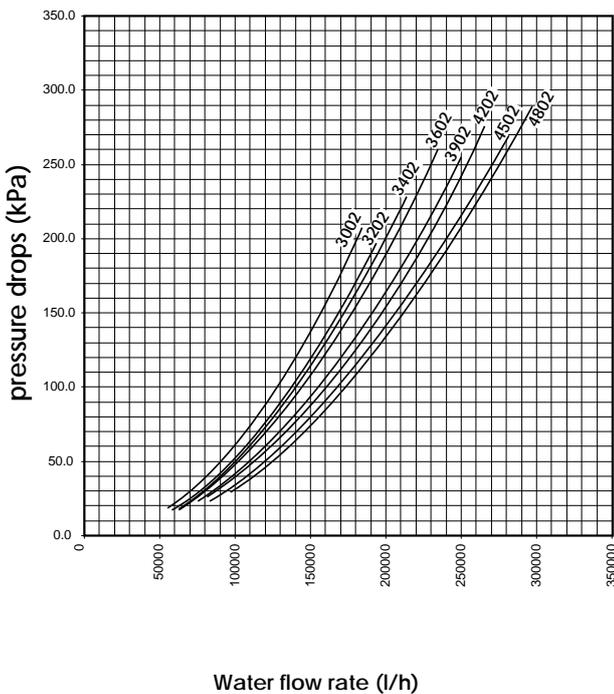

Pressure drops  
size 1251-1401-1601-1801-2101-2401

size 5002-5202-5402-5702-6003-6303-6603-6903-7203

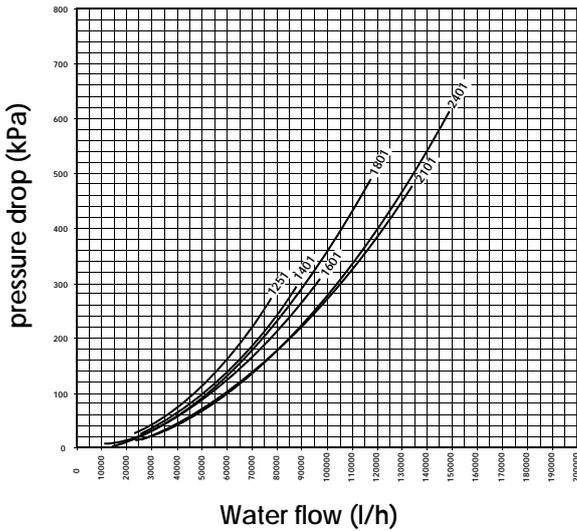

17.2. VERSION WITH SINGLE PUMP (PA - PC - PE - PG - PJ)

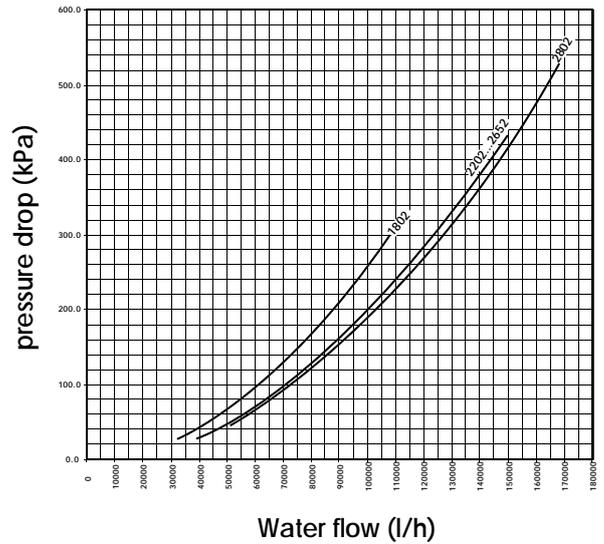

The pressure drops in the diagram are relative to an average water temperature of 10 °C.  
The table states the correction to apply to the pressure drops on variation of the average water temperature.

**Nominal reference conditions:**  
- Water inlet temperature 12 °C  
- Produced water temperature 7 °C  
- External air temperature 35 °C  
- Δt 5k

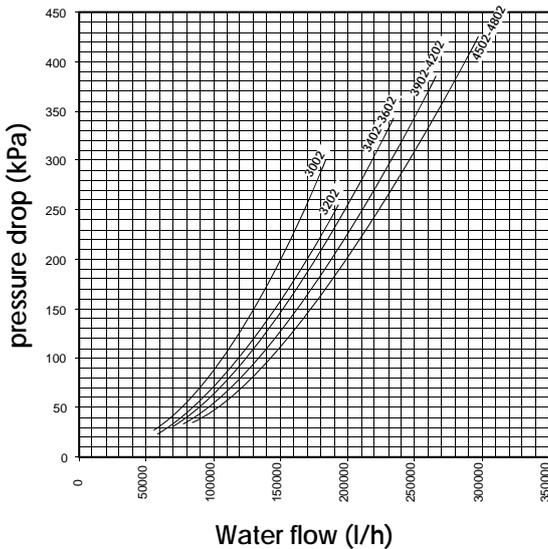

Pressure drops  
size 1251-1401-1601-1801-2101-2401

Average water temperature °C	5	10	15	20	30	40	50
Multiplicative coefficient	1.02	1	0.985	0.97	0.95	0.93	0.91

17.3. VERSION WITH SINGLE PUMP AND RESERVE PUMP (PB - PD- PF- PH- PK)

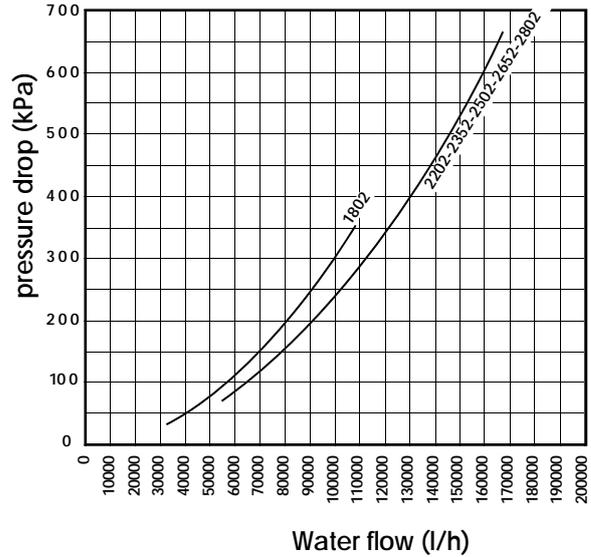

The pressure drops in the diagram are relative to an average water temperature of 10 °C.  
The table states the correction to apply to the pressure drops on variation of the average water temperature.

**Nominal reference conditions:**  
- Water inlet temperature 12 °C  
- Produced water temperature 7 °C  
- External air temperature 35 °C  
- Δt 5k

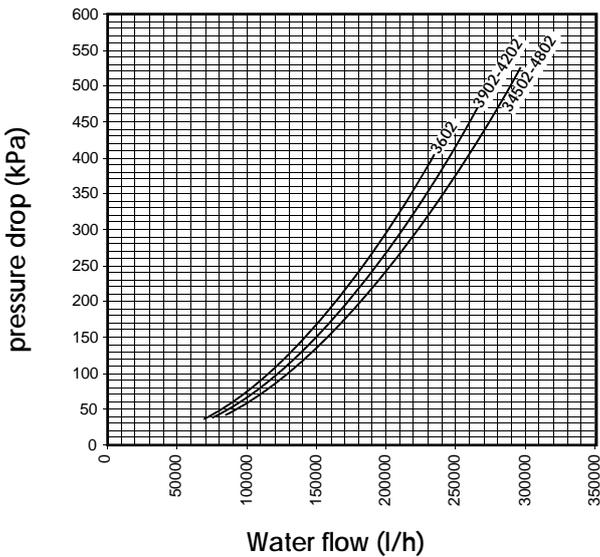

Pressure drops  
size 1801-2101-2401-2801-3201

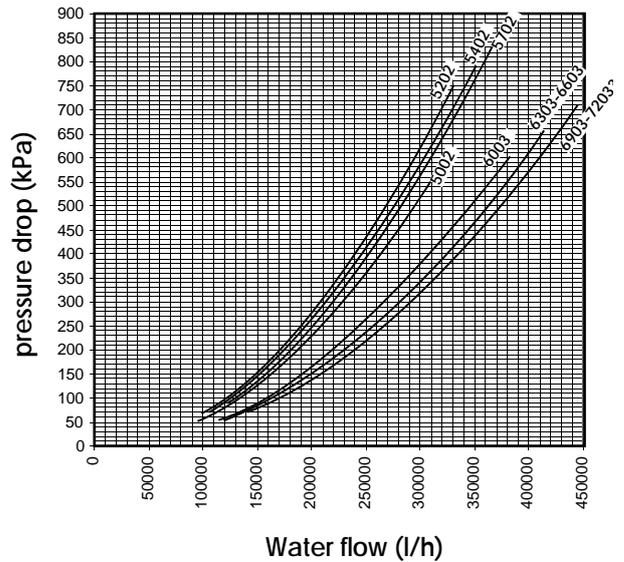

Pressure drops  
size 1802-2202-2352-2502-2652-2802

Pressure drops  
size 3602-3902-4202-34502-4802

Pressure drops  
size 5002-5202-5402-5702-6003-6303-6603-6903-7203

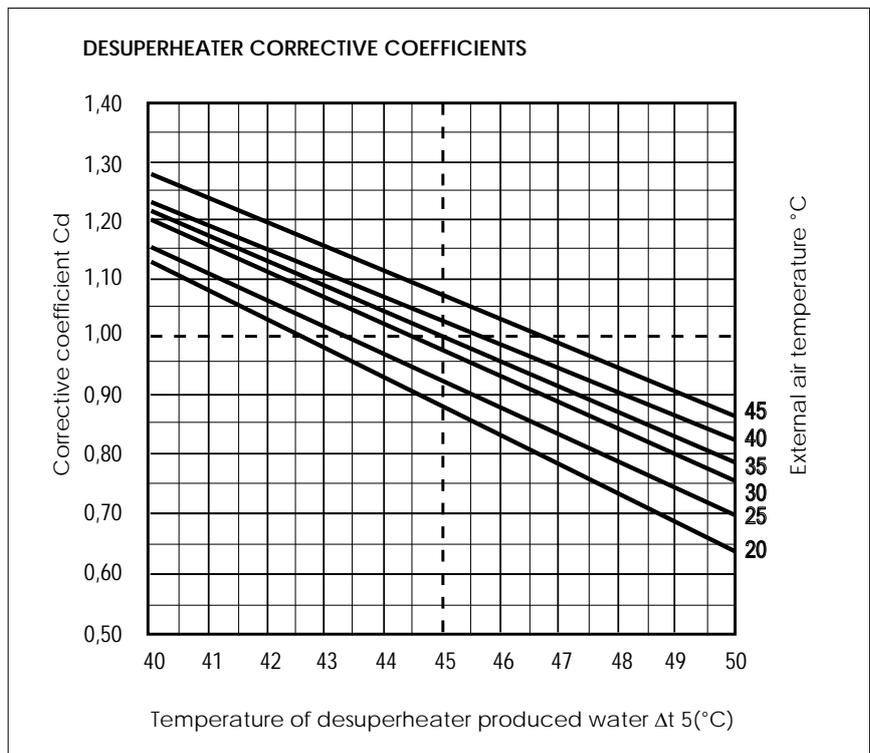

Corrective coefficients to apply to pressure drops							
Average water temperature °C	5	10	15	20	30	40	50
Multiplicative coefficient	1.02	1	0.985	0.97	0.95	0.93	0.91

## 18. DESUPERHEATER

The heating capacity that the desuperheater can achieve is attained by multiplying the nominal value ( $P_d$ ), by a relevant coefficient ( $C_d$ ).  
 The following diagrams show how to obtain corrective coefficients to use for units in their various versions in cooling mode; external air temperature, to which reference is made, is shown in correspondence to each curve.

**Key**

$P_d$  = heating capacity recovered  
 $C_d$  = Corrective coefficient ( $P_c$ )

## 19. DESUPERHEATER PRESSURE DROPS

The NS models with desuperheater can have up to 3 desuperheaters, 1 per circuit, according to the size.

NOTE  
 THE PARALLEL HYDRAULIC INSTALLATION IS THE RESPONSIBILITY OF THE INSTALLER.

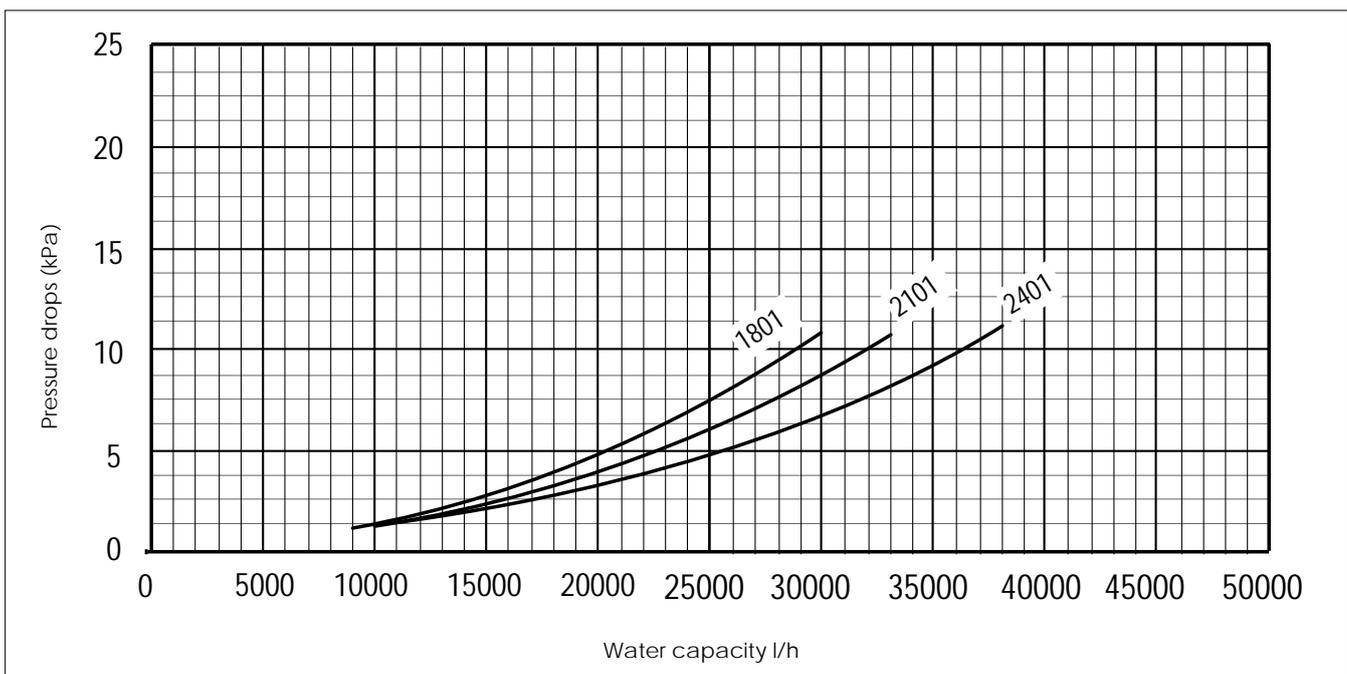

**NOTE:**

The features of the desuperheaters and the pressure drop curves are given below.  
 For produced water temperature values different from 45 °C, multiply the results obtained by the corrective factor shown in figure 11.1.1.

Nominal value referred to:

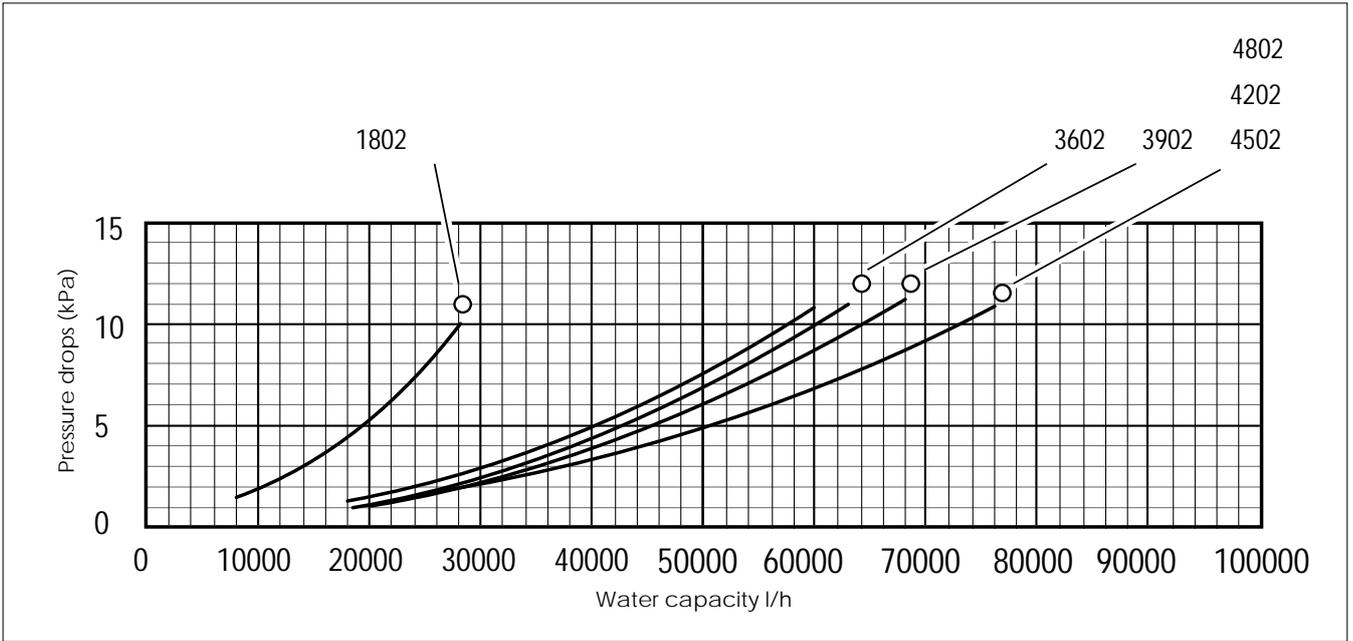

Air temperature ..... 35°C  
 Water to the desuperheater ..... 40/45°C  
 $\Delta t$  ..... 5°C

Models 1801- 2101 - 2401

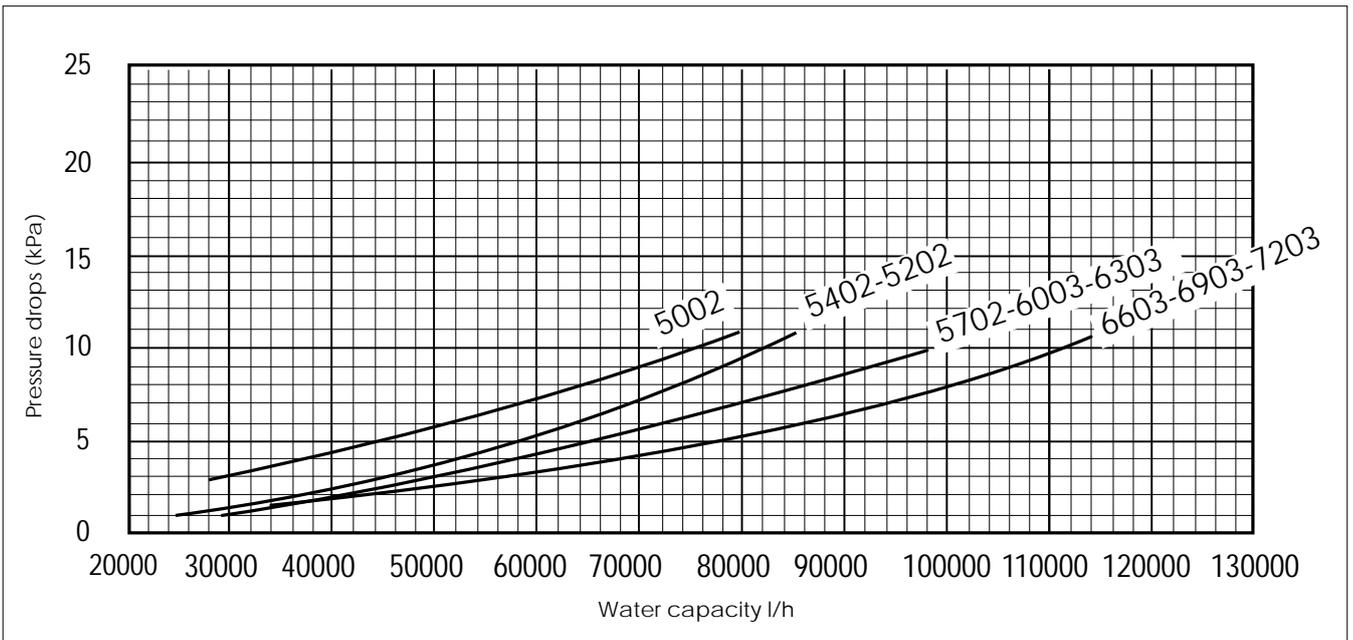

Corrective factors for water temperature different to nominal				
Average water temperature °C	30	40	45	50
Multiplicative coefficient	1.03	1.01	1	0.99

Models 1802 - 3602 - 3902 - 4202 - 4502 - 4802

Models 5002-7203

Corrective factors for water temperature different to nominal				
Average water temperature °C	30	40	45	50
Multiplicative coefficient	1.03	1.01	1	0.99

## 20. PUMPS

### 20.1. PUMP SELECTION

#### Pump selection example

##### NS 3202A

Useful static pressure required 180 kPa.  
 Nominal water flow rate = 110940 l/h  
 Nominal pressure drop = 92 kPa per circuit.

Procedure:

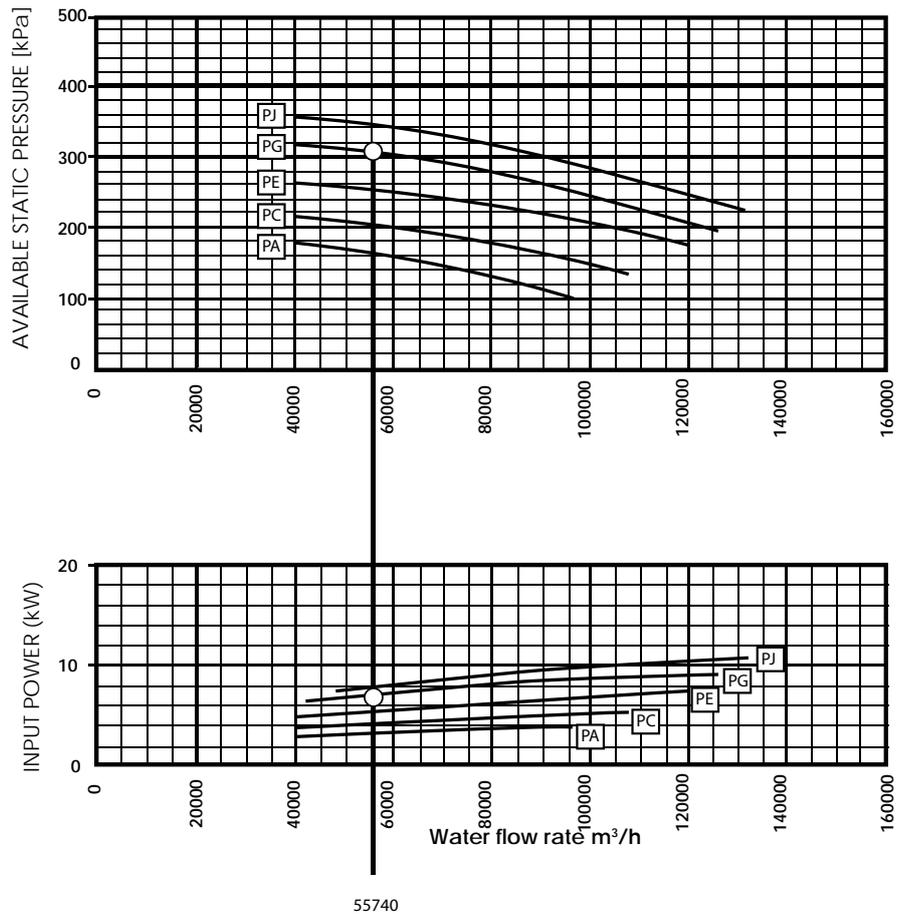

1. Divide the nominal flow rate by 2 (2 circuits) 110940/2 = 55470 l/h

Enter the water flow rate obtained (55470 l/h) into the graph as shown in the example at the side, which leads to the result that pump J must be used in order to meet a useful static pressure of 180 kPa, which offers:

Pump G = 320 kPa

2. At this point, in order for the system to reach a useful static pressure, simply deduct the evaporator pressure drop from the pump static pressure:

kPa pump (PG) - Nominal pressure drops:  
 320kPa - 92kPa = 228 kPa of useful static pressure to the system. (48 kPa exceeding the requirement).

Field	Pumping unit	PE	with pump E
00	Without pump	PF	With pump E and reserve pump
PA	with pump A	PG	with pump G
PB	With pump A and reserve pump	PH	With pump G and reserve pump
PC	with pump C	PJ	with pump J
PD	With pump C and reserve pump	PK	With pump J and reserve pump

#### ⚠ ATTENTION:

The pump will be the same for all the hydraulic circuits that make up the selected model.

Verify that the water flow rates are compatible with the features of the relative pumping unit.

## 21. EXPANSION VESSEL CALIBRATION

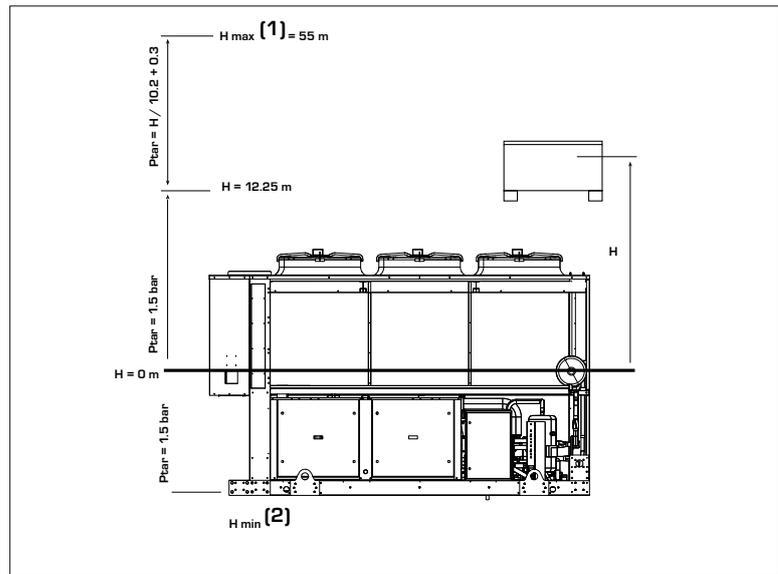

Standard pressure value of the expansion vessel when empty is 1.5 bar, whereas their volume is 25 litres and the maximum value is 6 bar.

The calibration of the vessel must be regulated in accordance with the maximum level difference (H) of the user (see figure) using the following formula:

$$p \text{ (calibration) [bar]} = H \text{ [m]} / 10.2 + 0.3.$$

For example: if level difference (H) is equal to 20 m, the calibration value of the vessel will be 2.3 bar.

If calibration value obtained from formula is less than 1.5 bar (that is for  $H < 12.25$ ), keep calibration as standard.

Key:

[1] Check that the highest installation is no higher than 55 metres.

[2] Check that lowest installation can withstand overall pressure in that position.

## 22. WATER SYSTEM CONTENT

Minimum water content	U.M.	(1)	(2)
1251	m <sup>3</sup>	1,9	3,9
1401		2,2	4,4
1601		2,4	4,9
1801		2,9	5,9
2101		3,3	6,5
2401		3,7	7,5
1402		2,1	4,3
1602		2,4	4,8
1802		2,8	5,6
2002		3,2	6,3
2202		3,5	6,9

Minimum water content	U.M.	(1)	(2)
2352	m <sup>3</sup>	3,6	7,3
2502		3,8	7,6
2652		4,0	8,1
2802		4,3	8,6
3002		4,6	9,3
3202		4,9	9,7
3402		5,4	10,7
3602		5,9	11,7
3902		6,2	12,4
4202		6,7	13,3
4502		7,0	14,0

Minimum water content	U.M.	(1)	(2)
4802	m <sup>3</sup>	7,5	14,9
5002		7,8	15,6
5202		8,3	16,6
5402		8,8	17,6
5702		9,1	18,3
6003		9,6	19,2
6303		9,9	19,9
6603		10,4	20,8
6903		10,7	21,4
7203		11,2	22,4

### MINIMUM SYSTEM CONTENT

- (1) Minimum water content for air conditioning applications.  
 (2) Minimum water content for process applications or operating with low external temperatures and low load.

### 23. SOUND DATA

#### 23.1. CHILLER MODE HIGH-EFFICIENCY VERSION [A]

**COOLING**

- Water inlet temperature 12 °C  
 - Produced water temperature 7 °C  
 - External air temperature 35 °C  
 - Δt 5

**SOUND PRESSURE** measured at 10 m in free field with directionality factor Q=2, according to ISO 3744.

**SOUND POWER** Aermec determines the sound power value on the basis of the measurements made in compliance with the ISO 9614-2 Standard

Power supply voltage 400V

**ATTENZIONE**

The "NS" cannot be silenced in freecooling functioning mode, because the fans work at maximum speed  
 Therefore, for noise data refer to A versions.

Mod. NS "B"	Total sound levels			Octave band [Hz]

## 24. CALIBRATION OF SAFETY AND CONTROL PARAMETERS

CONTROL PARAMETERS			
Cooling Set	Water input temperature in cooling functioning mode.	MIN.	4°C
		MAX.	15°C
		DEFAULT	7.0°C
Anti-freeze intervention	Intervention temperature of the anti-freeze alarm on the EV side (water output temperature).	MIN.	-9°C
		MAX.	4°C
		DEFAULT	3°C
Total differential	Proportional temperature band within which the compressors are activated and deactivated.	MIN.	3°C
		MAX.	10°C
		DEFAULT	5°C
Autostart	Auto
