# General standards

The present manual is an integral part of the documentation enclosed with the machine.

It must be conserved for future reference and must accompany the machine throughout its working life.

The manual defines the purpose for which the machine was built and establishes the correct installation and use limits.

- All use, installation and maintenance instructions of the unit are described in this manual as well as the main accident prevention standards.
  - Read carefully and fully all information contained in this manual before the installation, starting, use, maintenance and cleaning of the unit. Pay particular attention to the use regulations accompanied by the words "DANGER" or "WARNING": failure to observe them could cause damage to the machine and/or persons and property.
  - For irregularities not contemplated by this manual, consult the local After Sales Service.
  - Aermec S.p.A. declines all responsibility for any damage due to the improper use of the machine, or to the partial or superficial reading of the information contained in this manual.
  - Installation and maintenance must be carried out by trained and qualified personnel, having the requirements laid down by law 46/90 and/or DPR 380/2001 for electric/electronic and air conditioning installations, with consequent registration at the local CHAMBER of COMMERCE.
- Otherwise Aermec S.p.A. decline all responsibility regarding the safety of the product.

**THE MANUFACTURER DECLINES ANY RESPONSIBILITY FOR DAMAGE TO PROPERTY, PERSONS OR ANIMALS CAUSED BY THE NON-OBSERVANCE OF THE INDICATIONS AND REGULATIONS CONTAINED IN THIS MANUAL.**

Even though a suitable risk analysis was carried out during the design of the TN unit, pay ATTENTION to the pictograms on the machine; these make it easier to read the manual, quickly drawing the reader's attention to risks that cannot be avoided or sufficiently limited with the adoption of protection means and measures.

## GENERAL DANGER SIGNS

Carefully observe all indications at the side of the pictogram.

The non observance of the indications could cause hazardous conditions with possible injury to the operator and to the user in general.

## VOLTAGE DANGER SIGN

Carefully observe all indications at the side of the pictogram.

The signs indicate components on the unit or, in the present manual, identify areas that could generate risks of an electrical nature.

## GENERAL WARNING SIGNS

Carefully observe all indications to the side of the pictogram that limit some actions in order to ensure greater safety for the operator.

## MAIN GUARANTEE CONDITIONS

- The guarantee does not include payment for damages due to incorrect installation by the installer.
- The warranty does not include payment for damage due to the improper use of the unit by the user.
- The manufacturer is not responsible for injuries to the installer or user, caused by incorrect installation or improper use of the unit;
- The equipment must be installed in such a manner so as to permit maintenance and/or repair operations;
- The guarantee does not cover in any case costs due to turntable ladders, scaffolding or other similar elevating systems that are necessary to carry out operations under guarantee.

The warranty is not valid when:

- the services and the repairs have been carried out by non-authorised personnel or companies;
- the unit has been repaired or modified in the past with non OEM spare parts;
- the unit has not been adequately maintained;
- the instructions given in this manual have not been observed;
- if non-authorised modifications have been made.

## NB

The Manufacturer reserves the right at all times to make any modification for the improvement of its product and is not obliged to add these modification to machines of previous manufacture that have already been delivered or are being built.

The warranty conditions are any subject to the general sales conditions at the moment the contract is finalised.

## Description of the unit

The TN series provides an alternative to the air handling unit in the range with

flow rates of 2300 to 23000 m<sup>3</sup>/h when only filtration, cooling and/or heating

treatment is required: intended for civil, commercial, industrial or hotel plant for small and medium size areas. The units can be installed horizontally or vertically for greater flexibility of use. The units of this range are characterised by their compact size, low noise levels, and the wide choice of accessories.

Alongside the BASE configuration, there is also an UPRATED version to provide greater fan head.

## Description of components

### Structure

The TN series has the following characteristic elements:

The structure is made of aluminium profiles with sandwich cover paneling made of galvanised steel on the inside and pre-coated RAL 9002 galvanised steel on the outside with polyurethane insulation (density 40 kg/m<sup>3</sup>) with 25 mm thickness.

Both the panels of the base unit as well as the panels of the plenum have preshearing that render them compatible with the insertion of the accessories.

The fixing of the paneling using a panel block profile ensures a perfect seal between the panel and the frame and makes it extremely easy to mount and remove the panels.

The 3-way corner joint is made of glass-fibre reinforced nylon.

The condensate drip tray, in galvanised steel, has a threaded drain connection on both sides and can be used whether the unit is installed horizontally or vertically.

### FANS

The fans are of the double suction centrifugal variety with high performance forward blades.

### MOTORS:

The electric motors are of the three-phase asynchronous variety, enclosed construction and externally ventilated, squirrel cage rotor, B3 configuration with horizontal shaft, in conformity with IEC, CEI, UNEL standards (degree of protection IP55), single speed (4 poles).

### TRANSMISSIONS:

The pulleys have a variable diameter for a better calibration of the fan.

The transmission belts can be SPA or SPB. The pulleys are supplied with "Taperlock" tapered locking set and are statically and dynamically balanced.

### HEAT EXCHANGE COILS WITH WATER

Made of copper tube and aluminium finning blocked using mechanical expansion of the tubes; the main one can have 4 to 6 rows (hot or cold) and the secondary one 2,3 o 4 rows (just hot).

### FILTERS

The air is filtered through synthetic filters, 50mm thick, in efficiency class G4 (in compliance with standard EN 779), positioned at the suction point. The filters can be easily extracted for maintenance and cleaning they are housed on guidetracks in the main coil section.

The filters are extracted by withdrawing them laterally through the door on the side of the panel with the connections.

For the FTMxT accessory, filtration takes place using compact filters with an F7 degree of filtration.

## Identificazione dell'unità

P: Uprated

Version

4: 4 row water coil

6: 6 row water coil

Size

1: maximum air flow rate in cooling → 3000 mc/h

2: maximum air flow rate in cooling → 4100 mc/h

3: maximum air flow rate in cooling → 5600 mc/h

4: maximum air flow rate in cooling → 7300 mc/h

5: maximum air flow rate in cooling → 9500 mc/h

6: maximum air-flow rate in cooling → 11700 mc/h

7: maximum air-flow rate in cooling → 15500 mc/h

8: maximum air-flow rate in cooling → 20000 mc/h

# Accessories

## - PLxT Plenum

Composed of pre-sheared panels that can be opened on 3 sides, it can be mounted as an inlet or as an outlet; it is compatible with the accessories GAxT, GMxT, SAxT and TPPxT. It includes mounting brackets and feet (only for the horizontal configuration).

## - FT7MxT F7 compact Outlet filters of the fans

Compact filters with F7 filtration, composed of a plenum that can be opened on two sides, which can be positioned on the outlet of the machine; it is compatible with the accessories GMxT, SAxT and TPPxT. It includes fixing plates and feet (just for the horizontal configuration).

## - B2RxT Hot water coil with 2 rows for lines with 4 tubes

Positioned internally at the base of the equipment, downstream from the main coil, and made of copper piping and aluminium finning blocked by the mechanical expansion of the pipes.

## - B3RxT Hot water coil with 3 rows for lines with 4 tubes

Positioned internally at the base of the equipment, downstream from the main coil, and made of copper piping and aluminium finning blocked by the mechanical expansion of the pipes.

## - B4RxT Hot water coil with 4 rows for lines with 4 tubes

Positioned internally at the base of the equipment, downstream from the main coil, and made of copper piping and aluminium finning blocked by the mechanical expansion of the pipes.

## - SAxT Suction damper

Air calibration damper with galvanised steel fins. Fin pitch 50mm; galvanised steel adjusting pin : can be installed on the equipment base or the plenum.

## - GMxT Outlet grille with adjustable fins

Grille with double row of fins that can be adjusted when emitting air into the room. Can be installed on the plenum.

## - GAxT Suction grille

With fins fixed at an angle of 45°; Can be installed directly on the equipment base or on the plenum accessories.

## - TPVSxT Protective roof for Vertical installation with top outlet

Composed of a pre-coated metal sheet, fastened to the side of the unit.  
To be installed on the unit base

## - TPVFxT Protective roof for Vertical installation

Composed of pre-coated diamond sheet, fastened to the side of the unit.  
To be installed on: PLxT, FT7MxT and vertical unit base with front outlet.

## - TPLxT Protective roof for horizontal installation with Front outlet

Composed of pre-coated diamond sheet, fastened to the side of the unit. To be installed on unit base

## - TPPLxT Protective roof for Plenum for horizontal installation with Front outlet

Composed of pre-coated diamond sheet, fastened to the side of the unit. To be installed on PLxT and FT7MxT from size 3 to size 8.

## - TPFTLxT Roof for protecting Pocket filters for installation on Line with Front outlet

Composed of pre-coated diamond sheet, fastened to the side of the unit. To be installed on FT7MxT on sizes 1 and 2

## - P50MBT Corner support feet for both the horizontal and vertical version

made of galvanised sheet: they can be fixed directly to the unit with the screws supplied.

## - P50ACT Lateral support feet for the horizontal version.

made of galvanised sheet: they come with the accessories unit together with the bolts and screws.

V - O = This accessory can be mounted on both the Vertical and Horizontal versions;

V = This accessory can be mounted only on the Vertical version;

O = This accessory can be mounted only on the Horizontal version;

\* = On sizes 3 to 8 the TPPLxT roofs are assembled.

## Compatibility of accessories

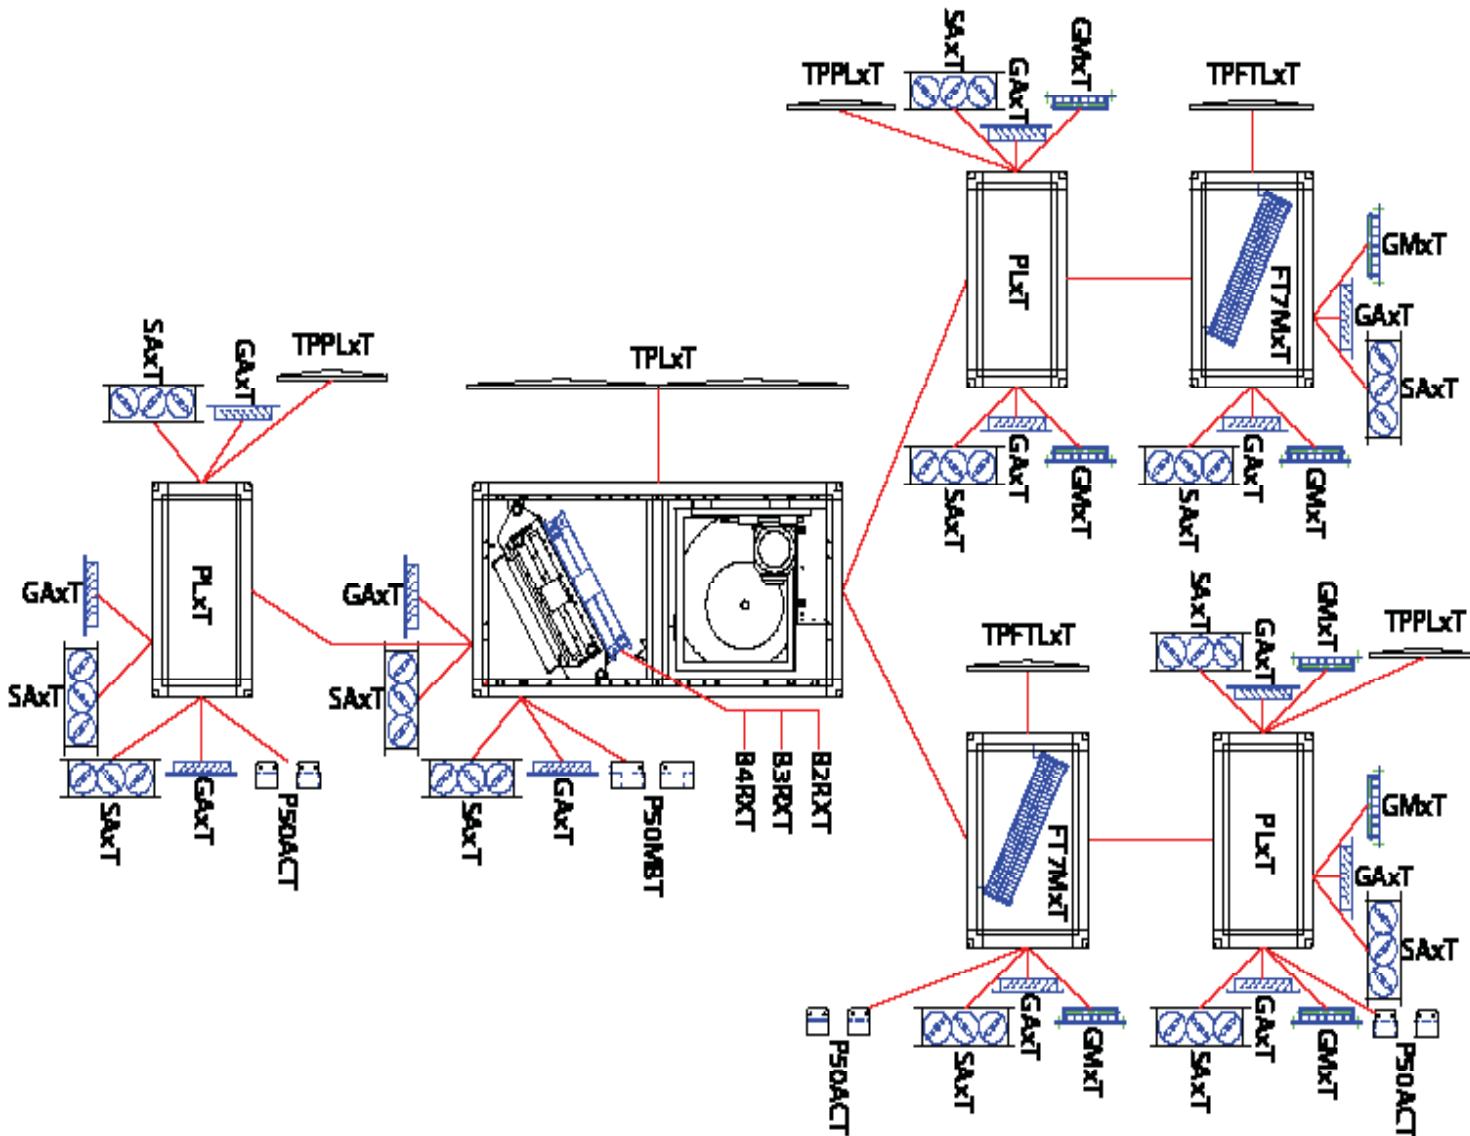

The various ways of combining the accessories with the unit are shown in the diagrams below. The diagrams show a horizontal and

vertical configuration of the unit respectively.

The diagrams may not fully represent all the available

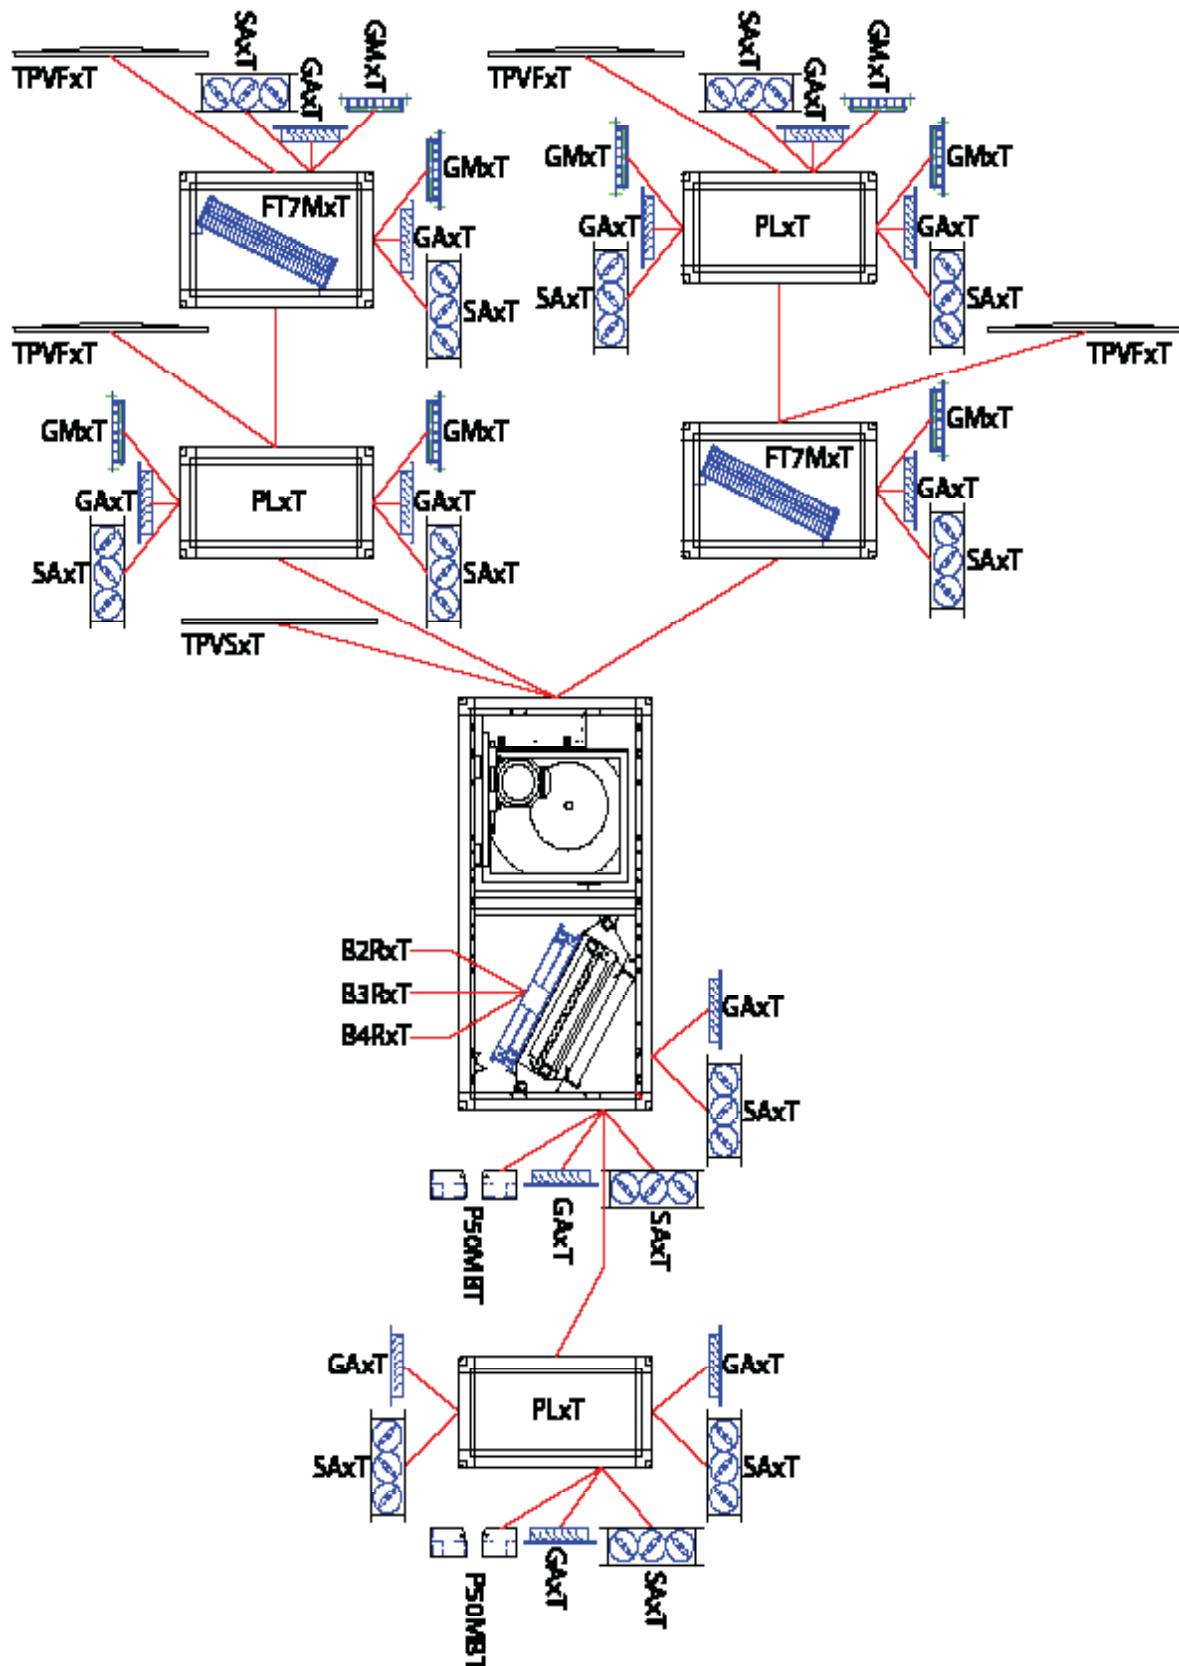

combinations: you are, however, advised to respect the rules laid out and to contact the Aermec Technical/Sales Office if necessary.

Diagram of the compatibility of TN accessories - horizontal installation.

NB: if the fan is rotated with the outlet towards the bottom, outlet accessories are not compatible

Diagram of the compatibility of TN accessories - vertical installation

NB: if the fan is rotated with the outlet at the front, the only compatible accessory on the outlet of the machine is the roof (TPVFxT)

# Characteristic ventilation curves

The following graphs represent, for each size, the indication range of the ventilating units composed of a fan, electric motor and pulley with a variable diameter.

## 1. Structure of the graphs:

In each graph you can see:

1.a) the performance curve for the version with a base ventilating unit (version "B" unit): the performance curve is enclosed by the continuous line and represents the maximum static pressure of the fan unit (top line) and the minimum static pressure of the fan unit (bottom line);

1.b) the performance curve for the version with a uprated fan unit (version "P" unit): the performance curve is enclosed by the dotted line and represents the maximum static pressure of the fan unit (top line) and the minimum static pressure of the fan unit (bottom line);

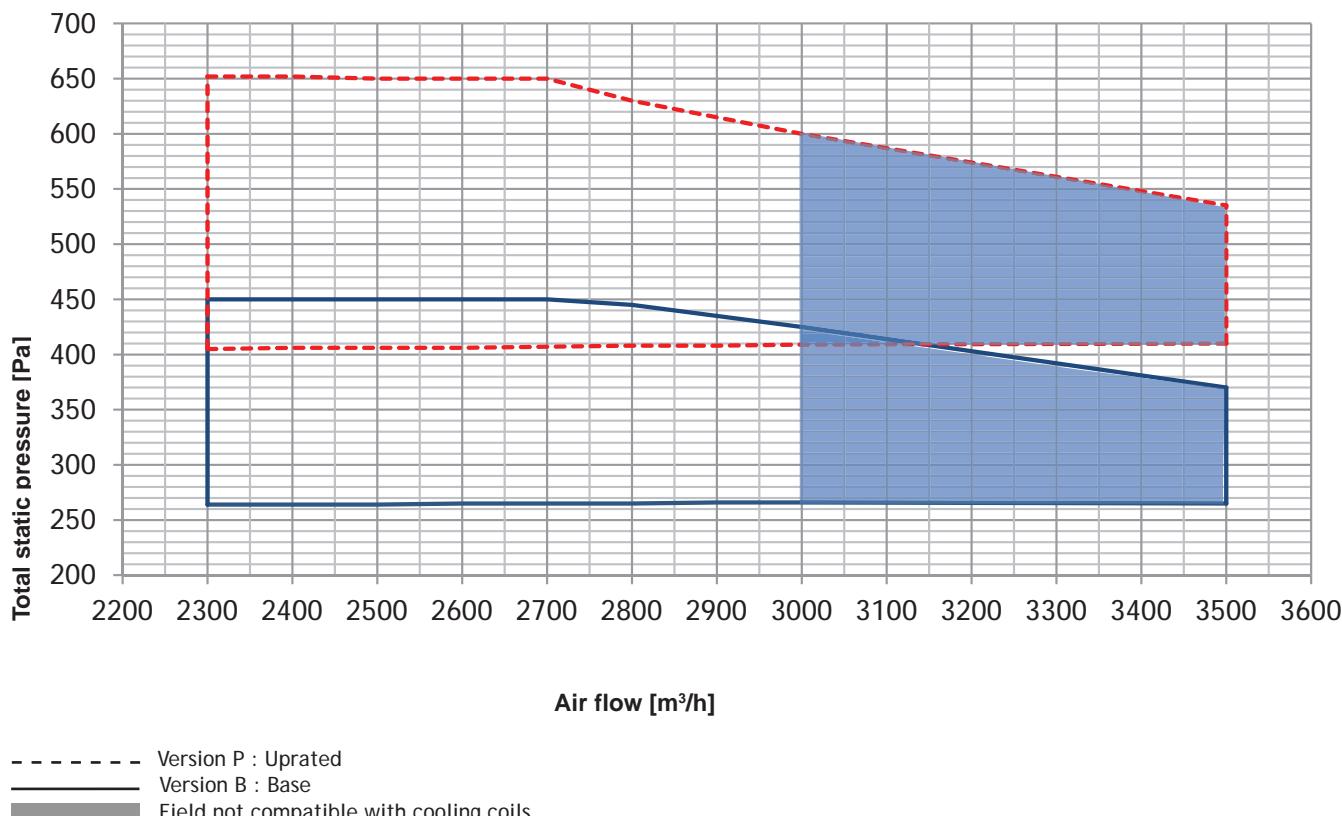

1.c) highlighted areas inside the performance curve: they represent the flow rate ranges that are not compatible with the use of cold coils. Therefore, if the unit has a cold coil, the performance curve of the fan unit is limited to the areas that are not highlighted; if the unit has a hot coil, the performance curve of the fan unit extends also to the areas that are highlighted;.

## 2. Using the graphs for verification:

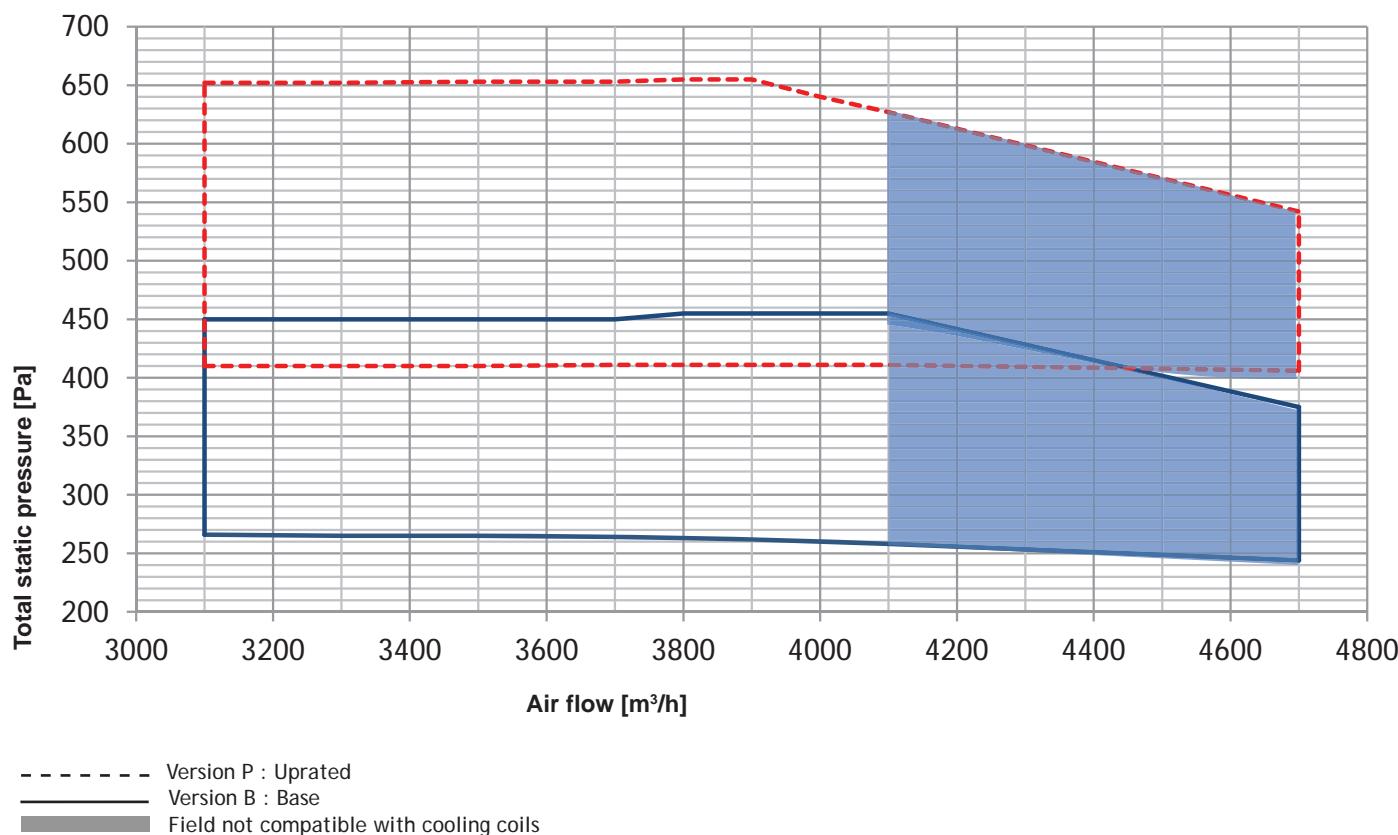

- the desired operating flow rate is identified: the permissible minimum and maximum flow rates have to be within the vertical segments of the workspaces. If there are cold coils, the maximum flow rate is limited (see point 1.c);
- you add the useful static pressure that you want to have available for the delivery flow with the pressure drops of the internal component to the flowrate that has been identified (table below the graphs);
- check that the pressure value is within the indication range of the base fan unit (version "B" unit) and/or the uprated fan unit (version "P" unit).

## 3. Use of the graphs for sizing:

- identify the desired flow rate: the permissible minimum and maximum flow rates have to be within the vertical segments of the workspaces. If there are cold coils, the maximum flow rate is limited (see point 1.c);
- go to the top lines of the performance curves of the base or uprated fan unit. Identify the total pressure value supplied by the base or uprated fan unit, from this value subtract the pressure drops of the internal components at the identified flow rate (table below the graphs): this results in the maximum useful static pressure delivered by the unit.

## Table showing operating limits

Temperature of coil inlet air (winter) (*)	min	-5°C (*)
Temperature of coil inlet water (Cold Water)	min	4°C
	max	12°C
Thermal head cold water	min	5°C
	max	8°C
Temperature of coil inlet water (Hot Water)	value	80°C
Thermal head hot water	min	5°C
	value	20°C
Percentage of ethylene glycol	value	30 %

(\*) envisage anti-freeze protection

## Tables showing heat exchange coil output

On the following pages you will find the tables concerning the

performance of the heat exchange coils for the typical combinations

of heat vector fluid temperature and hygrothermometric characteristics of the incoming air.

Key:

P	Air flow rate [ $m^3/h$ ]
Tia	Temperature of incoming air [°C]
UmRel	Relative humidity (%)
Qtot	Total heating capacity [kW]
Qsen	Sensible heating capacity [kW]
WtrFlow	Water flow rate [l/h]
WtrDP	Water side pressure drops [kPa]

## COOLING

# INSTALLATION, USE AND MAINTENANCE MANUAL

## General safety requirements

**WARNING!**

The units of the TN range are designed for the public and service sectors: any other use (in highly corrosive environments, in the presence of potentially explosive surroundings, etc.) is not permitted.

### Installation and maintenance

Before installation, make sure that the unit has not been damaged during transportation: the use of a damaged machine may be hazardous.

Installation and supplementary maintenance must be carried out by trained personnel in accordance with the present laws.

The unit must not be used as recovery of equipment or spare parts. Any other use other than that indicated in the present manual may be hazardous and is therefore prohibited.

Before starting any maintenance or cleaning operations, make sure the units are disconnected from the power supply and that it cannot be reconnected without the knowledge of the maintenance engineer.

During maintenance and cleaning, take

care of possible scalding from heating coils.

Before starting the unit, make sure that the electrical parts have been connected to the building's earth system.

During installation, maintenance and cleaning, Personal Protective Equipment (PPE) must be worn and the correct tools used.

### Access to the unit

Access to the unit once it has been installed must only be permitted to qualified operators and technicians. The operator is a person who has been authorised by the owner of the machine to carry out operations on the said machine (in accordance with the indications given in this manual). The technician is a person authorised by Aermec, or subordinate under their own responsibility by a Aermec distributor, to carry out operations on the machine. The owner of the machine is the legal representative of the

company, entity or individual owner of the system in which the Aermec machine is installed. These persons are responsible for the observance of all safety standards indicated in this manual and the existing law.

### Residual risks

The installation, start-up, shutdown and maintenance of the machine must be carried out in accordance with that stipulated in the technical documentation of the product and in such a manner that no hazardous situations are generated. The machine has been designed so as to reduce to a minimum the risks for the safety of those persons interacting with it. During the design phase, it was not technically possible to completely eliminate the risk causes. Therefore it is imperative to refer to the following instructions.

CONSIDERED PART	RESIDUAL RISK	METHOD	PRECAUTION
Inside the unit: finned heat exchanger coil	Small cuts	Contact	avoid contact, use protective gloves
Inside the unit: metal parts and electrical cables	Intoxication, electrocution, severe burns	Defective insulation of the power cables; live metal parts	suitable electrical protection of the power supply line; maximum care when earthing the metal parts
Outside the unit: Area around the unit	Serious burns	Fire caused by short-circuit or overheating of the power line	cable section and power supply line safety system conforming with existing laws

# Handling

## PACKAGING

The air conditioning units of the TN series are usually protected on the top with a polyethylene cover to prevent rain, leaves and/or small animals from entering.

## ON-SITE STORAGE

The units of the TN series should be stored under cover at about a temperature between 5 and 40 degrees centigrade, should not be put one on top of another, and no type of material should be put directly on top of them.

## TRANSPORT

Transportation must be carried out with the following precautions:

- the load must be well blocked on the lorry;
- protection to prevent contact with protruding parts such as the plumbing connections of the coils, outlets, dampers;
- protection of the load with tarpaulin or something similar;
- have side protections available to prevent rubbing between units positioned close together on the bed of the truck; remember that, since they stand upright on the bed of the truck, the units **CANNOT** be put on top of each other, nor support other material on their tops.

## CHECKS UPON RECEIPT

Upon receipt of the unit or single parts, an initial visual check must be made for any damage resulting from transportation. If damage is discovered, this must be highlighted on the accompanying travel document.

The checks are the following:

- dampers: check the integrity of the pins, fins and gears;
- filters: check quantity and type;
- finned coils: check the integrity of the manifolds, outlets and the finned pack if visible;
- panelling and base: check their integrity;
- check the integrity of the roof.

# Minimum operating spaces

All the necessary operating spaces must be checked before beginning the installation:

- the position of any canalisation of the intake and expulsion air;
- the passage of the electrical power supply cables;
- the correct maintenance and cleaning operations.

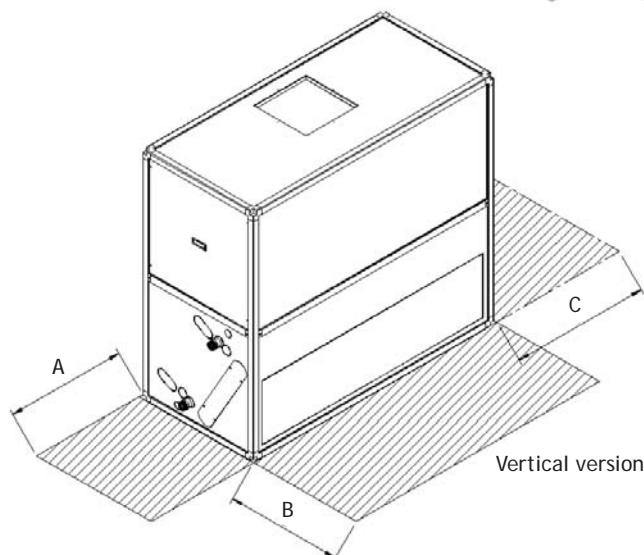

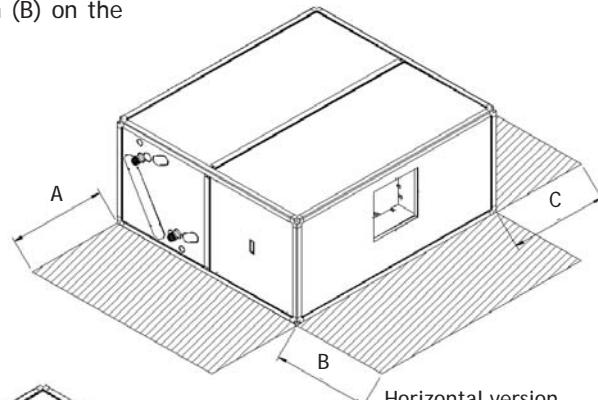

In particular:

- there must be a space of at least 200 mm in correspondence with the condensate discharge point, for the drain-trap (more detailed instructions can be found on the label attached to the discharge point itself);.

The optimal situation is a corridor of 700 mm (A) minimum on the inspection and header side and leave a distance equal to the width of the unit plus 100 mm (C) on the opposite side to remove the coils from the opposite side to the manifolds without having to dismantle the valve group.

If the unit has to be placed next to a wall, leave a corridor with a width equal to

that of the unit plus 100 mm (B) on the opposite side.

# Changing the base configuration

## Dismounting and assembling panels

All the panels of the unit, side, top and bottom can be dismounted and re-assembled.

For the standard unit, therefore vertical: to dismount the panels, first take out the panel block profiles of the sides (vertical) and later the top and bottom (horizontal) base profiles are removed.

Get a plastic hammer and a metal spatula; a - rest the spatula on the edge of the panel block next to the aluminium profile near a plastic bracket;

b - with the plastic hammer hit the spatula a few times in a direction opposite to the way the panel block went in, until it comes out completely;

c - continue to hit the panel block along the entire length of the profile until it comes out completely.

d - once all four panel blocks have been removed, the panel is free and can easily be removed.

To assemble the paneling, you should prop the panel in its position after checking its integrity;

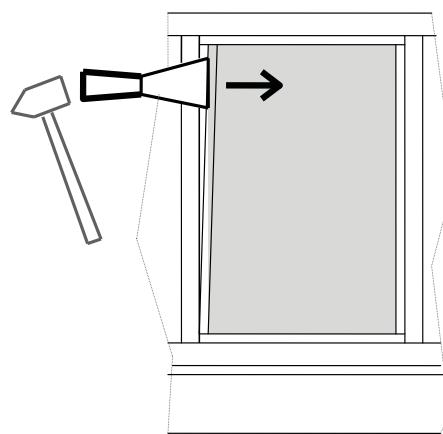

a - Rest the top base panel block on the slot of the aluminium profile near a bracket;

b - Use the plastic hammer to gently hit the panel block until it goes completely inside the aluminium profile (in order to avoid damaging the panel block with the hammer you can use a wooden cube [A] as a base);

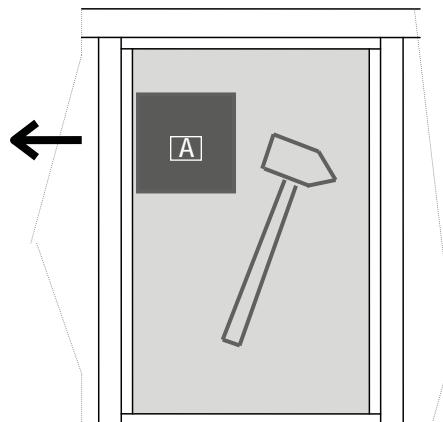

c - Repeat the procedure on the opposite part of the panel block;

d - Once both end parts have been inserted, continually hit along the entire length of the panel block so as to completely insert it into the aluminium profile.

e - Once the top has been fully inserted, proceed with the bottom (horizontal) and finally with the sides (vertical).

Dismantling panels

Re-assembling panels

## Panel shearing

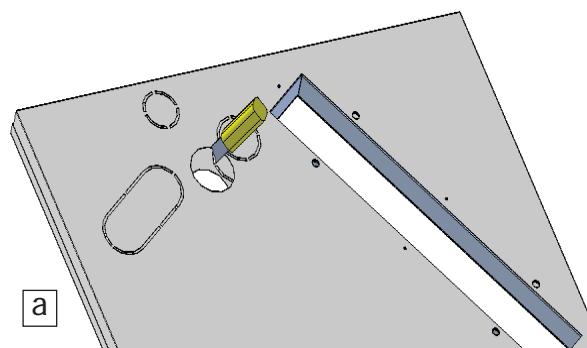

All the panels on which accessories are mounted (supply grille, damper, return grille, plenum) or which are part of the fan section, have been given pre-shearing. a - To make the necessary openings get a plastic hammer, a hammer chisel and a cutter.

With the hammer and the chisel separate the metallic tabs; once this has been done it is easy to cut the polyurethane foam around the edge of the pre-shearing with the cutter (a1).

b - Rest the panel in the correct position and check that all the openings are matched with the manifolds, condensate drains, grilles and dampers.

In the event that there is some interference, hammer the inside of the panel to fix this.

Cover all the old holes that have been used with the plates and small parts provided.

a

b

a1

## Changing the direction of the delivery flow of the fan

(THE UNIT IS ALWAYS SUPPLIED IN VERTICAL VERSION).

a - Put the unit on the ground in a horizontal position in such a way that the only panel of the fan section without any pre-shearing is facing the ground.

During this operation make sure that all the panels are fixed to the unit to make it more stable;

b - Remove the panel block profiles of all 4 panels of the fan section (two sides, one top and the ventilation one);

Pay attention to the weight of the fan that has to be handled: if the unit is larger than size 4 (fan weight = 24 Kg.), the fan should be handled by two people for safety reasons;

c - Loosen the tension of the belt using the screws of the tensioner slide (make sure to first loosen the lateral locking grub screw);

c1 - Slip off the belt (s) of the fan pulley;

d - Unscrew the screws that connect the fan and the extension mounted on its port;

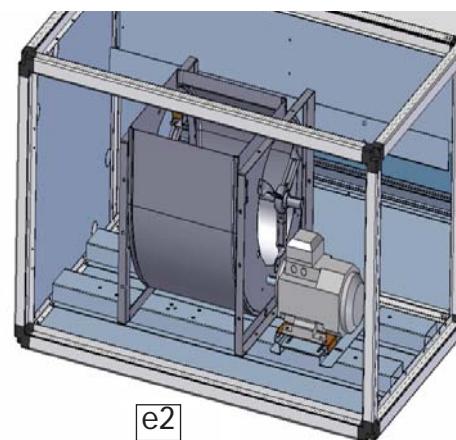

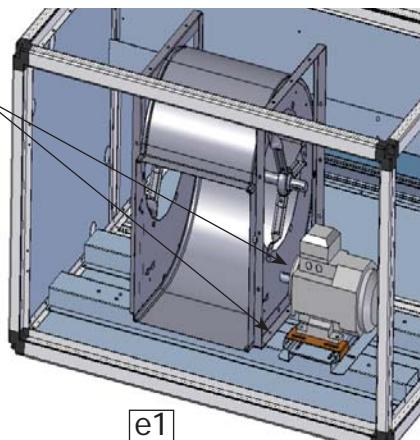

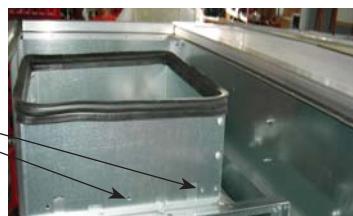

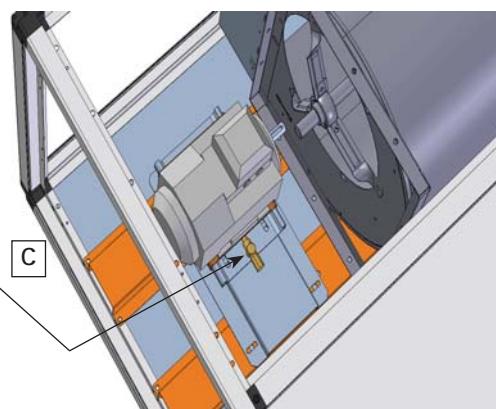

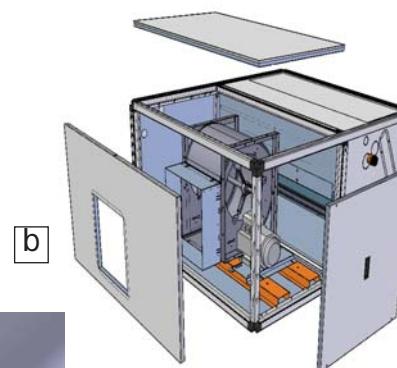

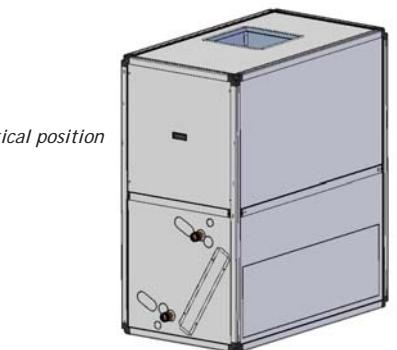

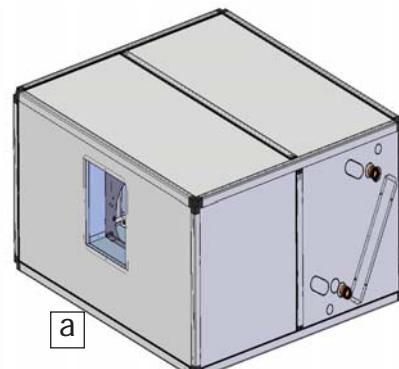

d1 - Dismantle the extension;

e1 - Remove the screws that fix the fan to the supports.

e2 - Turn it over by 90° making sure that the fan port is facing the desired direction. Re-assemble and tighten the screws fixing the fan to the supports;

f - Re-assemble the fan extension fixing it with the screws, making sure that the joints are in the right position;

*The base configuration is always in a vertical position*

g - With the aid of a rod, align the fan pulley and the motor pulley;

[g]

h - Insert the belt that had been previously dismantled between the two pulleys;

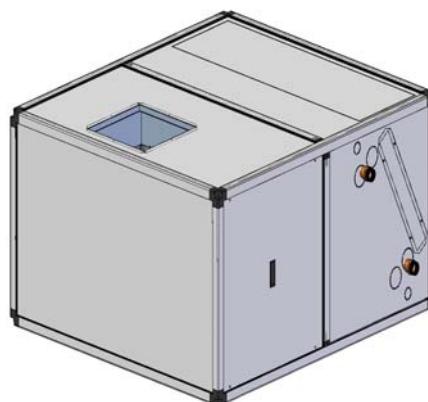

[i]

i - Using the adjustment screws of the belt tensioner, carry out the tensioning of the belt(s) and then fix the screws of the motor (IF THE BELT IS NOT ALIGNED WITH THE PULLEYS, REPEAT THIS STEP).

At the end of the procedure, tighten the grub screw of the slide to prevent any accidental decoupling;

[l]

l - Re-assemble the panels and the panel blocks

## Changing the Vertical - Horizontal or Right - Left configuration

The condensate drip tray is positioned so that the unit can operate in vertical position.

To ensure that the unit is fit for operating in a horizontal position it is absolutely necessary to change the position of the coil unit in the following way.

Put the unit on the ground in a horizontal position in such a way that the only panel of the fan section without any pre-shearing is facing upwards.

During this operation make sure that all the panels are fixed to the unit to make it more stable.

a - Remove the panel blocks and the panels on the connections side and those on the side opposite the connections side (do not damage the black rubber seals around the manifolds because they will be needed later);

b - Remove the flat filters from the unit; **C**

c - Unscrew the 2 screws of the coil unit block near the condensate drip tray: one towards the manifolds side and the other towards the opposite side;

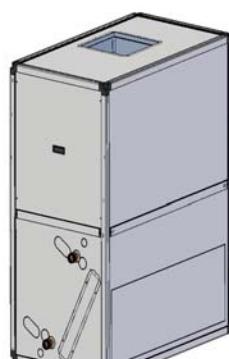

d - In two people, or with the help of suitable equipment, take out the coil-drip trays-filters block;

d1 - to change the configuration from vertical to horizontal re-insert the coil-drip trays-filters block with the correct inclination into the specially prepared guide-tracks;

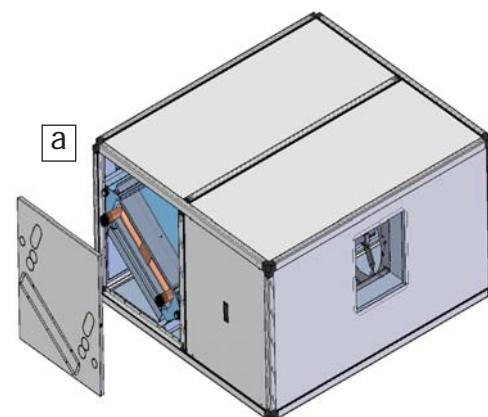

d2 - to change the connections side of the coil-drip trays-filters block overturn it and re-insert the block from the opposite side of the unit making sure to maintain the correct inclination.

Overturning the coil-drip trays-filters unit guarantees the countercurrent exchange.

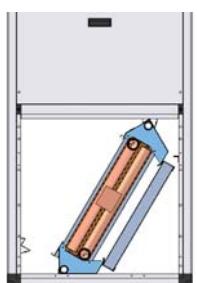

e - Fix the coil unit with its screw near the bottom condensate drip tray;

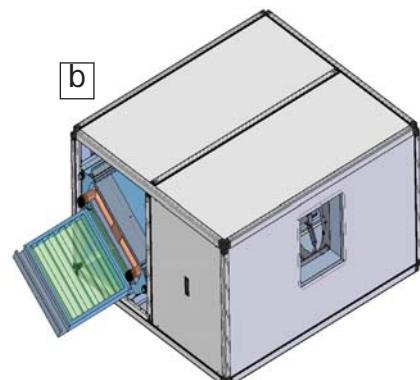

Standard version unit, Vertical

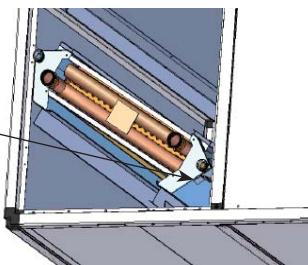

**a**

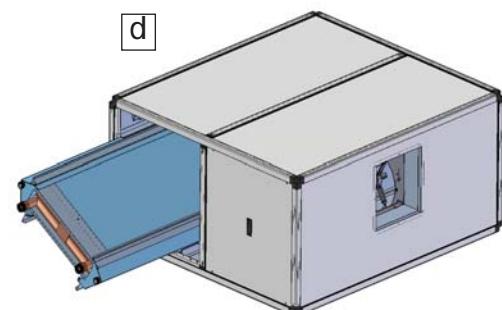

Position for the coil for vertical running

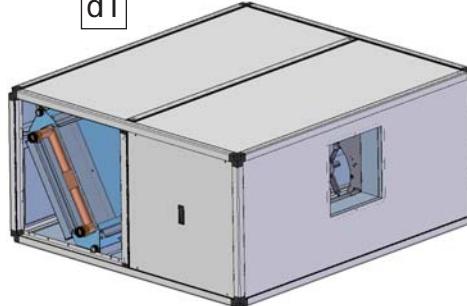

**b**

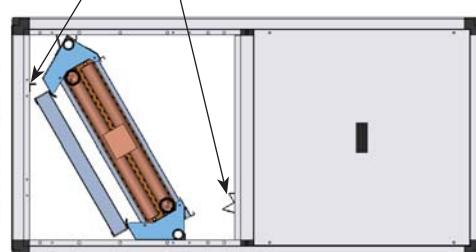

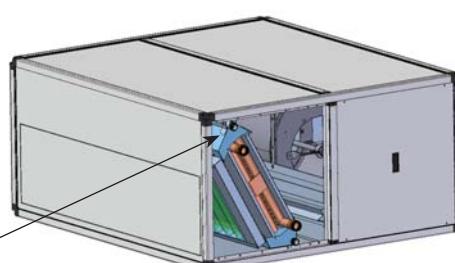

**c**

**d1**

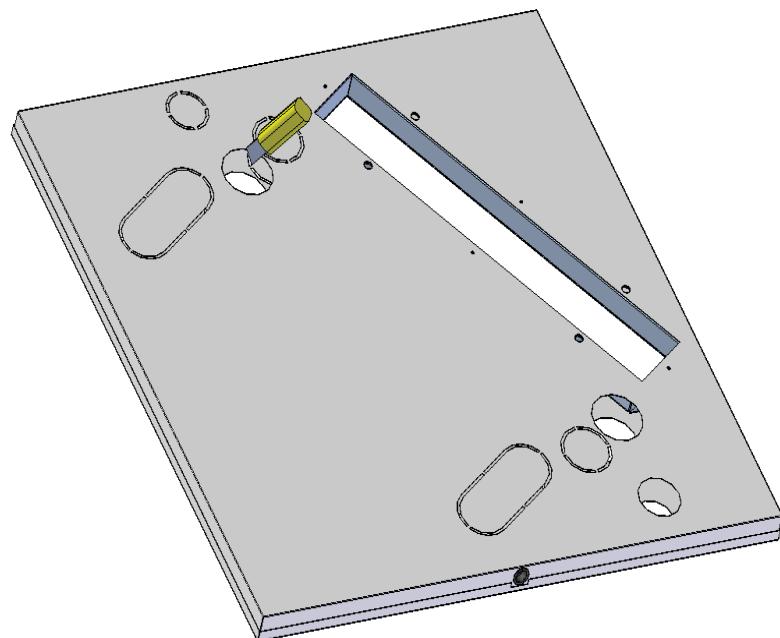

Guidetracks used in the vertical version.

New position for the coil for horizontal running.

f - With a plastic hammer and a small chisel separate the metallic micro-joints of the pre-sheared holes at the new position of the manifolds and the condensate drain; then finish off the holes with a cutter.

[f]

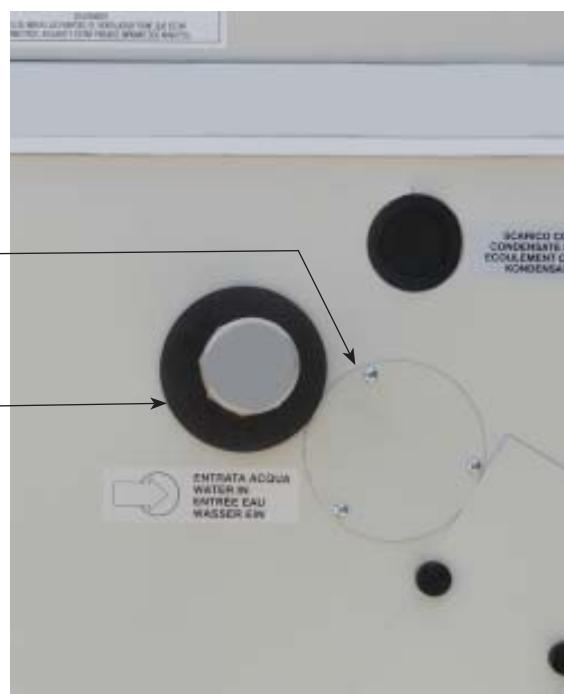

g - Check, and if required, restore the seal applied to the profile of the unit;

h - Re-insert the flat filters into their guiderails;

i - position the panels in their respective housings and fix them with their respective panel blocks;

j - With the round metal plates that were provided, cover the holes left open by the shifting of the heads;

m - Slip the black seals on the heads protruding from the panel.

## Inserting a second coil

a - Remove the panel blocks and the panels on the connections side and those on the side opposite the connections side (do not damage the black rubber seals around the manifolds because they will be needed later);

b - Unscrew the 2 screws of the coil unit block near the condensate drip tray: one towards the manifolds side and the other towards the opposite side;

- In two people, or with the help of suitable equipment, take out the coil-drip trays-filters block by about 20-25 cm.

c - With the self-threading screws provided with the accessory, put on the coil guiderails in accordance with the diagram on the side. Make sure that the two rails are different: one should be applied on the top drip tray and one on the bottom drip tray.

Both drip trays have three aligned holes on each side: the upper guiderail has just a single hole and the lower one has two.

The top guiderail is fixed to the central hole [c1] while the lower guiderail is fixed to the two holes at the end [c2];

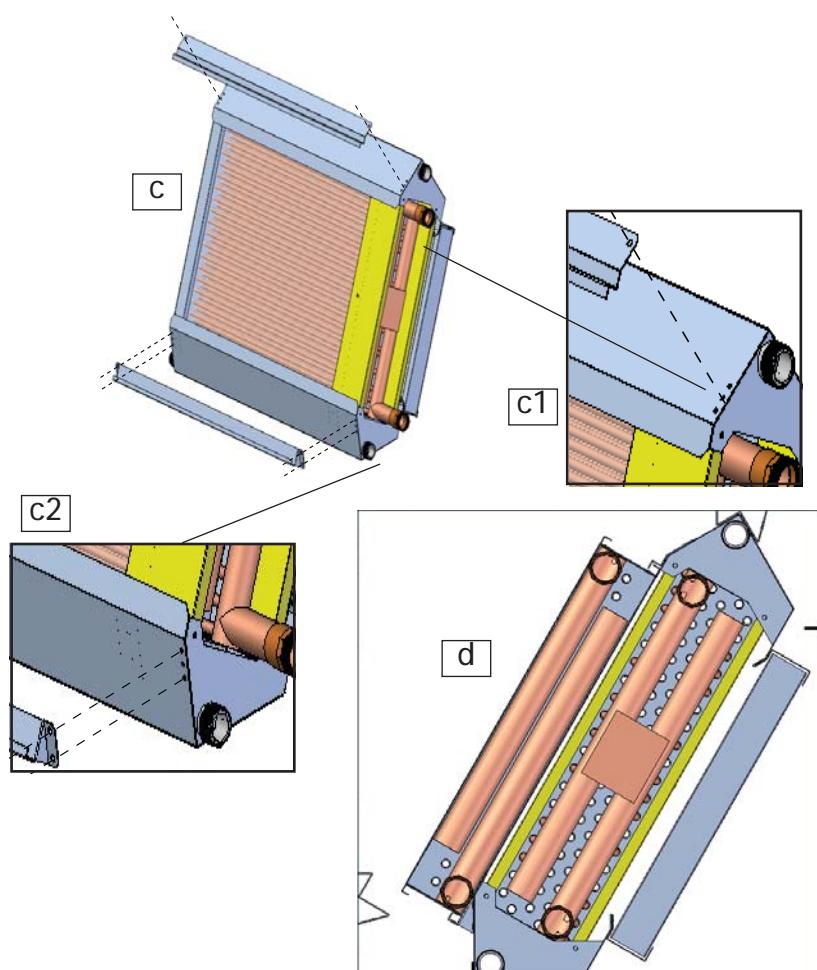

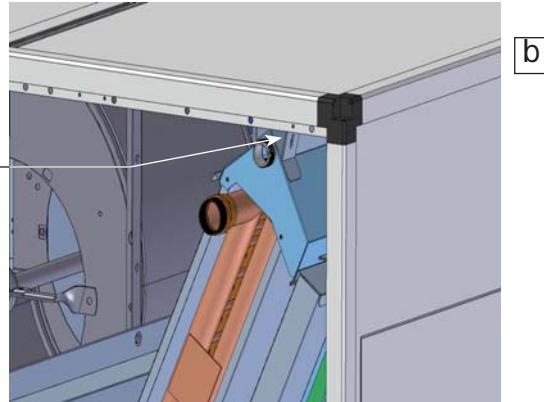

- Repeat the operation from the opposite side;

d - Then insert the second coil in the guide-rails (the diagram is not binding - it is just to show how the coil is applied);

f - Fix the coil unit with its screw near the bottom condensate drip tray;

g - Make new holes on the ventilation panel according to the position of the manifolds of the new coil.

h - Re-assemble the panels and the panel blocks.

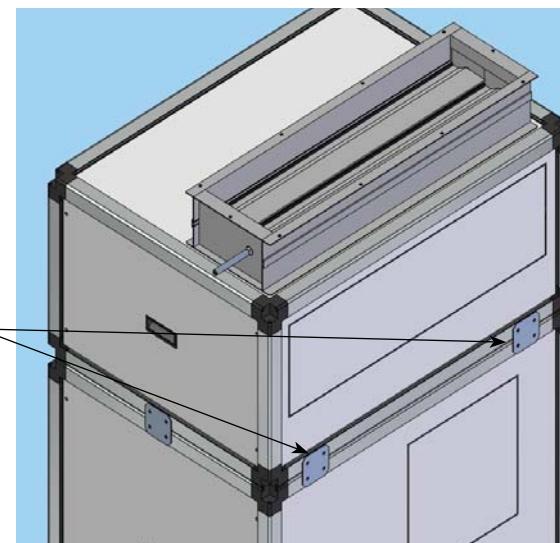

## Connecting the base unit - accessory modules

All the base units have been designed to facilitate configuration and customisation to the greatest extent possible, by way of modular accessories designed to fully satisfy the needs of the customer. To this end, standard connection modes have been provided in order to simplify the process of connecting the base unit and accessories or between multiple accessories and the unit itself.

Together with all the required accessories, an assembly kit has been supplied which consists of plates, screws and a flat self-adhesive seal to be applied to the adjoining walls in order to avoid air leaking between one module and another.

The assembly of the accessories can be carried out with the machine configured in a horizontal position as well as in a vertical position.

*The diagram on the side shows an example of a connection between the base unit and a plenum: the plates, the sealing and the screws are supplied as standard.*

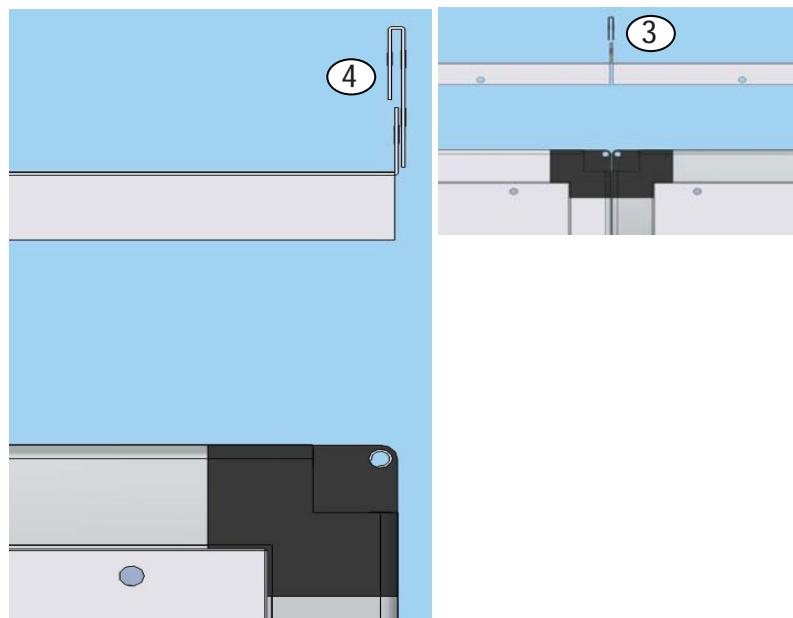

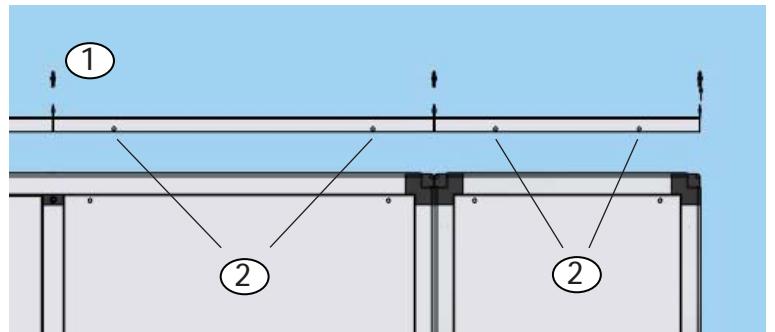

## Assembling the rain-proof roof (accessory)

To assemble the roof in the vertical version of the unit do as follows:

- 1 - rest the roof on the top part of the unit;
- 2 - fasten the side of the roof to the aluminium profile using the self-drilling screws provided. The holes of the roof have already been prepared.

To assemble the roof in the horizontal version of the unit do as follows:

- 1 - rest the roof on the top part of the unit;
- 3 - join the sectors of the roof with the covers of the intermediate flaps (for the small units the roof can be a single piece and therefore this operation might not be necessary. In any event, the operation is required where the roof of the base unit has to be solidly fixed to the roof of any eventual accessory modules);
- 4 - fix the final covers to the ends of the roof and then to the aluminium profile of the unit in such a way that the roof is solidly attached to the unit;
- 2 - fasten the side of the roof to the aluminium profile using the self-drilling screws provided. The holes of the roof have already been prepared.

## Assembling support feet (accessory)

The support feet are supplied in two varieties depending on their use: corner (1) or side (2). the base version of the unit (A) can have 4 corner feet to be applied, using the screws provided, on the bottom corners of the base; for both the vertical version and the horizontal version.

### In the horizontal version (just the base machine):

the 4 corner feet (1) are fixed to the lower profile on each corner (A);

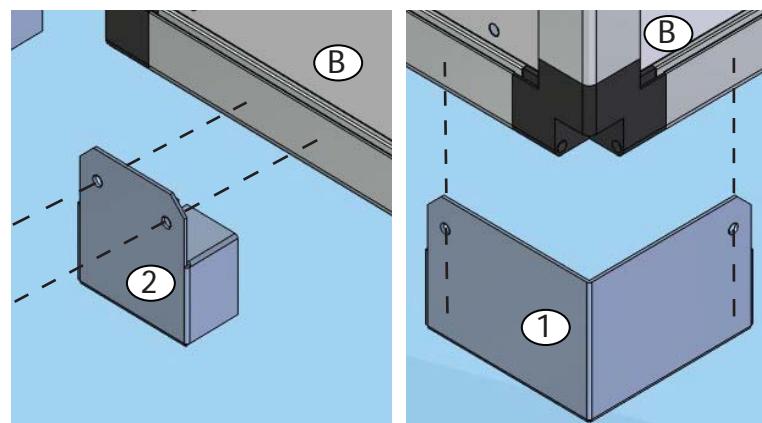

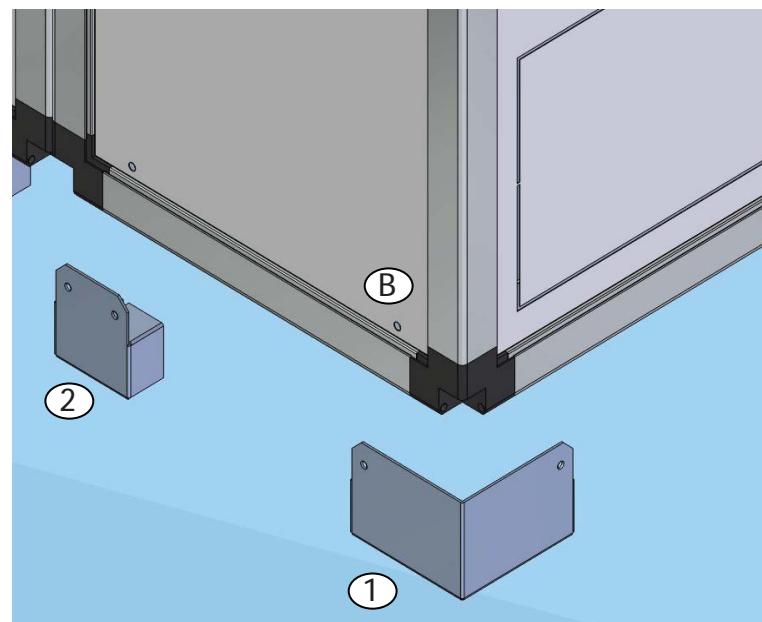

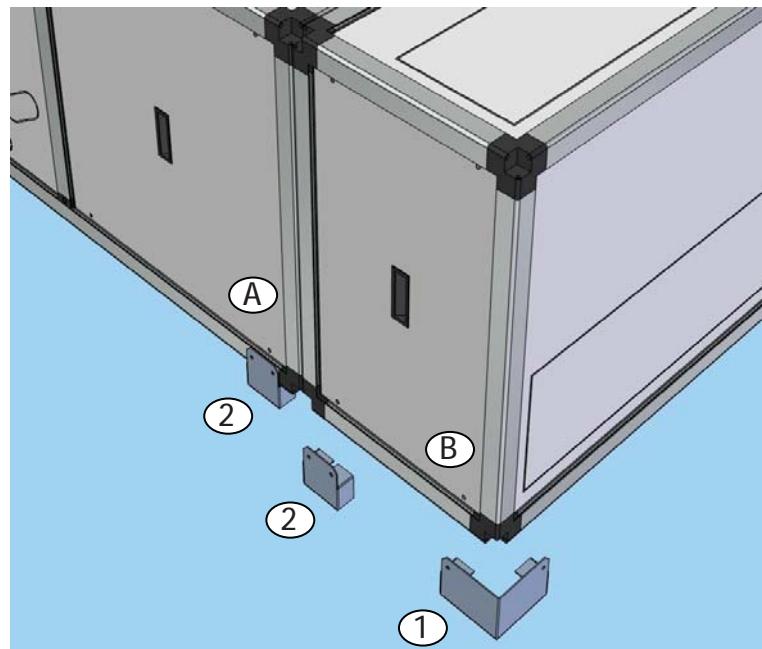

### In the horizontal version with plenum accessories:

the 4 corner feet (1) are fixed to the lower profile on each end corner of the complete unit (base + plenum) (B).

The 4 side feet (2) are fixed to the lower profile near where the plenum and the base unit are connected

**In the vertical version,** the 4 corner feet (1) will be fixed to the lower profile on each corner.

In the case where between the support surface and the base unit it is necessary to insert a plenum, the feet will be installed on this latter.

# Connections

## Aeraulic connections

**WARNING!**

It is prohibited to start the machine if the fan inlets are not ducted or are not protected by an accident-prevention system

For installation, proceed as follows:

- prepare suitable brackets to support the channelling so as to prevent them weighing on the unit;
- connect the delivery and intake ports to the channels with vibration-damping joints in between (canvas). The vibration-damping joint must be secured to the panel with self-tapping screws making sure that the canvas joints are taught when running;

- arrange an earth cable that acts as a bridge on the anti-vibration joint to guarantee the equipotential connection between the channels and the recovery unit;
- before connecting any bends or branches, etc., set out the delivery channel with a straight section with a length of at least 2.5 times the shorter side of the channel A, avoiding an inclination of more than 7° for the channelling (to avoid any possible reduction in fan performance levels).

## Hydraulic connections: condensate discharge

The condensate drip tray has a threaded outlet with a diameter of 1" M - 3/4" F. A discharge system must provide a suitable drain-trap to:

- allow the free discharge of the condensate;
- prevent the undesired entry of air in vacuum systems;
- prevent the infiltration of odours or insects.

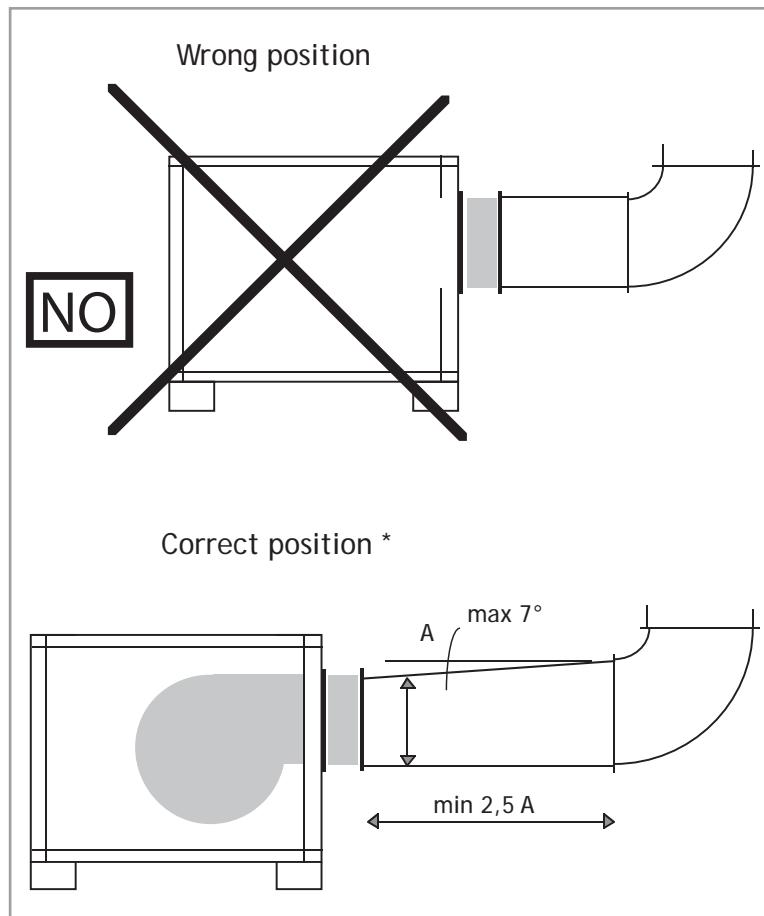

The lower part of the trap should have a discharge plug or should in any case allow easy dismantling for cleaning.

The instructions for the dimensioning and execution of the trap are as follows (see diagram below):

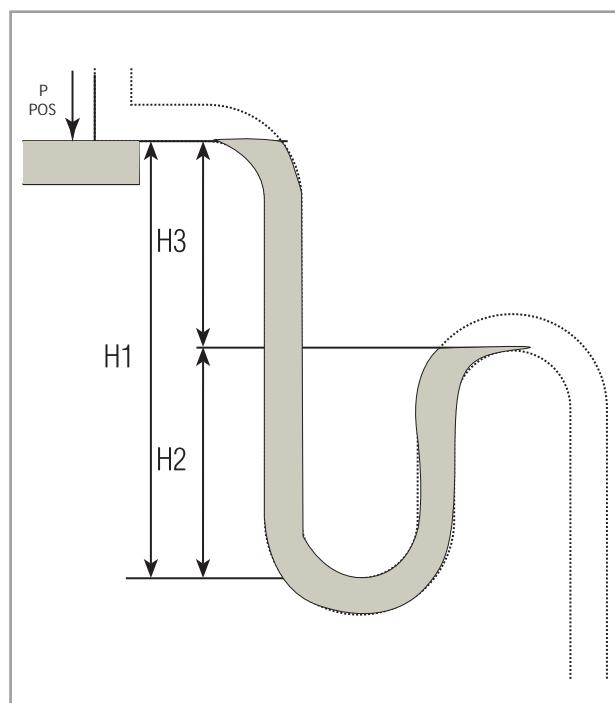

$$\begin{aligned} H1 &= 2P \\ H2 &= H1 / 2 \end{aligned}$$

where P is the pressure of the water column expressed in mm (1mm w.c. = 9.81 Pa).

It is important to provide suitable protection against the formation of ice inside the trap

\* = THE CORRECT POSITION SHOULD ALSO BE USED ON THE VERTICAL VERSION

Drain-trap measurements diagram

## Connection of water coils

All water coil manifolds have threaded male connectors for the entrance and exit of water.

For correct installation follow the simple indications below:

- anti-freeze devices should be present in the event of adverse weather conditions;
- the course of the piping must be such so as not to create obstacles in the event the coil must be removed and so as not to compromise inspection and maintenance of the unit and possible accessories;
- when screwing together the manifolds and hydraulic circuit, avoid stresses that could damage the coil manifolds;
- provide a stop valve to isolate the coil from the rest of the circuit in the even it must be disconnected from the hydraulic circuit;
- firmly clamp the pipes outside the unit, to prevent them weighing on the coil;
- for the connection of water feed pipes, follow the indications on the "WATER INLET" and "WATER OUTLET" plate on the outside panelling ;
- fit an air bleed valve on the highest section of the circuit and a water discharge valve on the lowest section of the circuit;
- once the connections have been made, position the external rubber seal flush with the panelling to avoid air seepage.

### WARNING!

To avoid burns during the heating function, the piping must be carefully insulated with suitable material as far as the panelling.

## Electrical connections: earth

### WARNING!

The electrical connections and wiring must be carried out by qualified personnel in accordance with the present laws.

### WARNING!

Each electrical appliance must be connected to the earth of the system.

Use the connectors with the earth symbol to connect the earth of the unit and possible accessories to the earth of the building.

## Mains power supply connection

### WARNING!

Make sure that the characteristics of the mains power supply are compatible with the electrical characteristics indicated on the machine's rating plate.

## Electrical connections: electric motors

### WARNING!

Make sure that the characteristics of the mains power supply are compatible with the electrical characteristics indicated on the part's rating plates.

Comply with the following instructions for the connection of the electric motors:

- this is carried out on the control boards mounted directly on the motor;

The motors are three-phase asynchronous with squirrel cage rotor, enclosed construction, external ventilation in compliance with the electrical characteristics of IEC 34-1 standards and CEI 2-3 1110, and for the dimensional characteristics with IEC 72 and UNEL 13113-71-IM B3.

Protection rating: IP55

Stator winding class: B

The single-speed electric motors and two power supplies with direct start, are star connected if the voltage is increased, or delta if less;.

Motor 220/400 V (up to 4 kW not included):

delta connection for 220V power supply;

star connection for 400 V power supply.

Motor 400/690 V (from 4 kW included and up) :

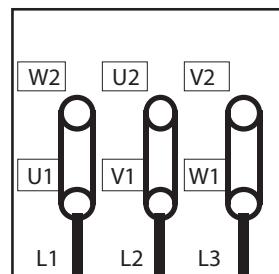

delta connection for 400V power supply;

star connection for 690 V power supply.

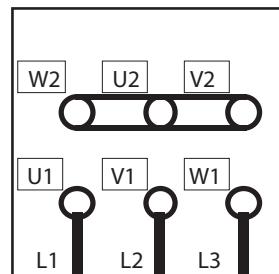

All motors can operate equally well in both rotation directions; The direction of rotation can be inverted by exchanging the two line connections to the stator clamps.

Typical diagrams of connecting three-phase electric motors are shown in the general diagram. In any event it is recommended that the diagram contained inside the control board of the motor or applied to the back of the cover of the control board itself is consulted.

## SINGLE SPEED MOTORS

DELTA

STAR

# First start-up

**WARNING!**

Make sure that all the indications in the present manual have been carried out before carrying out the controls on the first start-up.

Before starting up the unit, check:

- that the voltage on the terminals matches what is declared on the technical data plate applied to the outside panelling ± 5% controllable with a tester: if the voltage is subject to frequent changes, contact our Technical department for the choice of suitable protections;

nical data plate applied to the outside panelling ± 5% controllable with a tester: if the voltage is subject to frequent changes, contact our Technical department for the choice of suitable protections;

- that the unit is correctly secured;
- the connection of the unit to the building's earth;
- the channel connections;

- the connection of the condensate discharge with the trap;
- the insulation of the coil's supply pipes;
- the absence of air in the water coils;
- the closure of the examinable panels;
- the presence of voltage.

# Maintenance

**WARNING!**

Use suitable personal protective equipment (PPE) during maintenance operations

**WARNING!**

Before accessing the unit for maintenance or cleaning operations, make sure the unit is disconnected from the power supply, that the supply can not be switched on again without the maintenance engineer's knowledge and that the heat exchange coils are off.

**WARNING!**

Take particular care when working close to finned coils because the fins are particularly sharp.

**WARNING!**

After finishing the maintenance operations, always close the unit using the specific paneling, fixing them with their panel block profiles.

The units of the TN range have been designed to require less maintenance, and to make each operation easier. Below are some simple instructions for correct maintenance of the unit.

The maintenance program must in any case be carried out by a qualified technician.

## Routine maintenance

Routine maintenance consists of simple operations that should be carried out monthly, as follows:

- check the tightness of the screws fixing the fan;
- check that the machine's power supply cable has not undergone any alterations that could compromise its insulation;

- check the screws fixing the earth connections are tight.

## Fan maintenance

It is essential to check and clean the fans, to maintain the low noise level of the unit in the room where it is installed. Check every two months:

- the clean state of the impeller;
- the noise level of the bearings.

## Coil maintenance

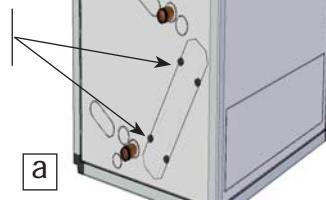

It is essential to check and clean the coils, to maintain the high standard of quality and renewal of fresh air in the room.

Check annually:

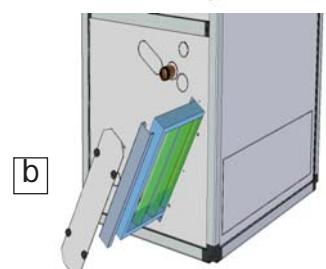

- the clean state of the finned unit.

## Removal and maintenance of flat filters (standard)

a - Unscrew the handwheels on the side panel;

b - Remove the side guiderail and the G4 flat filters;

c - Blow and/or wash the filter cells with water;

d - Insert the new or reconditioned filters in the guiderails remembering to also insert the side guide;

e - Close the panel again screwing in the plastic handwheels

Table of the number of flat panels used in the units.

TN	FLAT FILTER 400x207	FLAT FILTER 400x500	FLAT FILTER 400x625	FLAT FILTER 500x500	FLAT FILTER 500x625	FLAT FILTER 300x900

2		2				
3		3				
4					3	
5						3
6				1		3
7						6
8						8

## -Extraction and maintenance of compact filters F7 (accessory)

To access the compact filters proceed as follows:

a - Remove the side panel of the plenum by unscrewing the screws;

b - Take out the compact filters for checking and/or replacing them: remove the "clamps" that keep the filters joined to one another;

c - Insert the new filters complete with coupling "clamps";

d - Check the integrity of the seal on the aluminium profile to make sure it is tight;

e - Put back the side panel screwing in the screws.

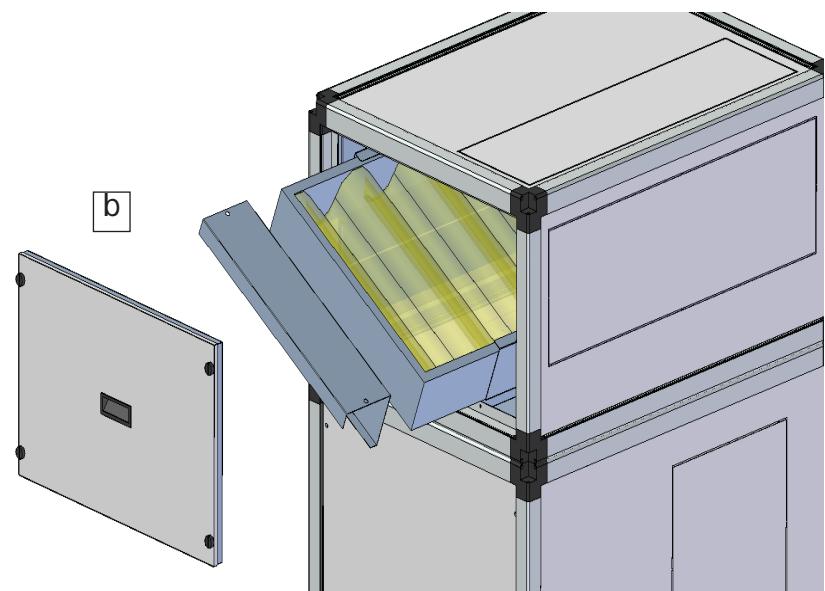

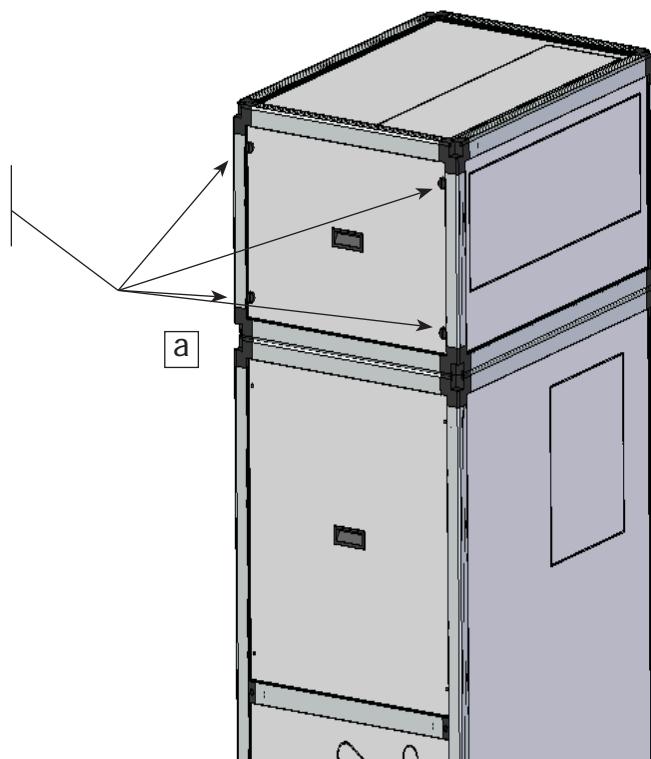

Table of the number of compact filters used in the units (accessory).

TN	COMPACT FILTER 290 x 490	COMPACT FILTER 595 x 490	COMPACT FILTER 595 x 595	COMPACT FILTER 595 x 882

7				3
8				4

## Motor replacement

To replace the unit's motor make sure that all the panels are fixed to the unit to make it more stable. After which you proceed as follows: (THE VERTICAL VERSION OF THE UNIT IS ALWAYS SUPPLIED).

a - Position the unit on the ground in a horizontal position so that the only panel of the fan section without any pre-shearing is facing the ground;

b - Remove the panel block profiles of all 4 panels of the fan section (two sides, one top and the ventilation one);.

c - Loosen the tension of the belt using the screws of the tensioner slide (c1) (make sure to first loosen the lateral locking grub screw);. Slip off the belt(s) of the fan pulley;

d - Unscrew the fixing screws of the motor at the slide and remove it;

e - With the hex key loosen and dismantle the pulley with its conical bush from the motor replaced;

f - Re-assemble and fix in the same order the bush and the pulley onto the new uprated motor;

g - Reposition the new motor on the slide and tighten the fixing screws;

g - With the aid of an aluminium rod, align the fan pulley and the motor pulley;

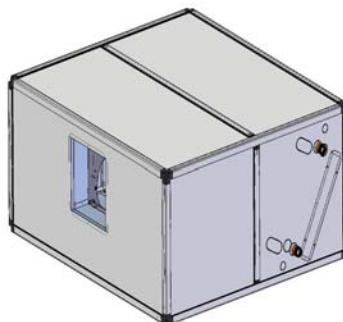

i - Insert the belt that had been previously dismantled between the two pulleys;

l - Using the regulation screw of the tensioner slide tension the belt(s) and, once this has been done, tighten the fixing screws of the motor (IF THE BELT IS NOT ALIGNED WITH THE PULLEYS, REPEAT THIS STEP).

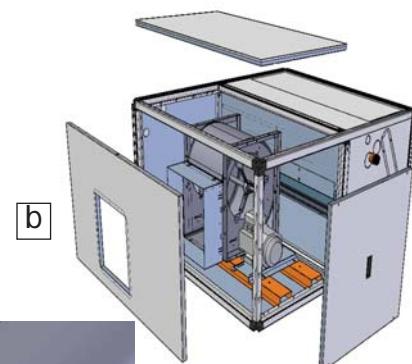

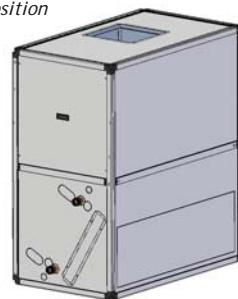

At the end of the procedure, tighten the grub screw of the slide to prevent any accidental decoupling;

m - Re-assemble the panels and the panel blocks.

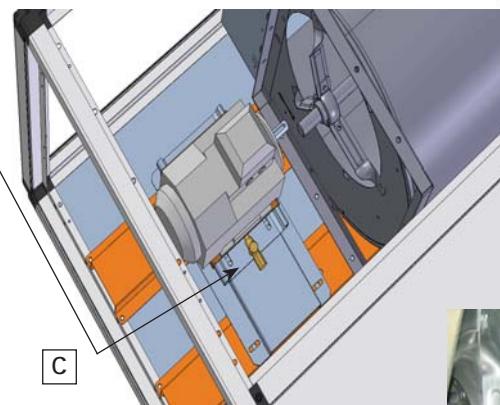

*The base configuration is always in a vertical position*

[a]

[b]

[c]

[c1]

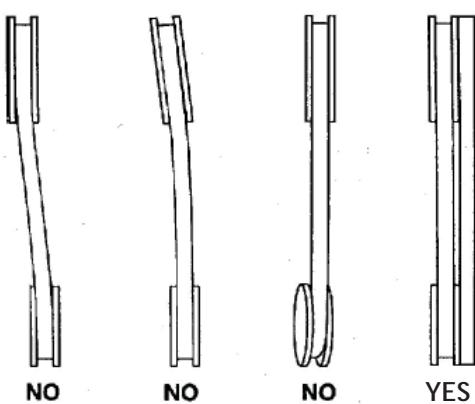

[h]

## Alignment of the pulleys

If the tension is incorrect the following will be occur:

- if the tension is weak the belt will wear out quickly and the transmission's performance will be low
- if the tension is excessive there will be damage to the bearings of the motor and to those of the fan.

Every time you tighten the belts, you need to check the alignment of the transmission using a RULER.

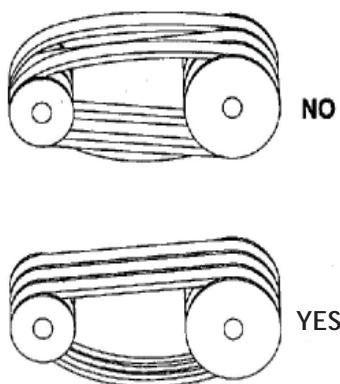

Section belt	Ø external min pulley	no pulley revolutions min. [r.p.m.]	F' minimum	F'' maximum
SPA	90-145	900-1800	25 N	35 N
	150-195	600-1200	30 N	45 N
	200-250	400-900	35 N	50 N
SPB	170-235	900-1800	35 N	45 N
	250-320	600-1500	40 N	60 N
	330-400	400-900	45 N	65 N

## Replacing the transmission belt

- loosen the transmission using the appropriate device and take out the worn belt;
- check the cleanliness and state of wear of the pulleys and, if necessary, replace them;
- insert the new belt without forcing it in the least; this is to prevent any microtrauma on the transmission that could prejudice its useful life;
- align and tighten the transmission;
- after 10 hours of operation, check the tension of the transmission again.

## Drives with pulleys having several races

- In the case of transmissions with several belts, these have to be replaced at the same time; in the same transmission, therefore, there should be no belts that are more worn than others;
- the number of belts should always match the number of races;
- in a transmission like the one considered, before tensioning the belts, these should be aligned from the same side, as shown in the following diagram

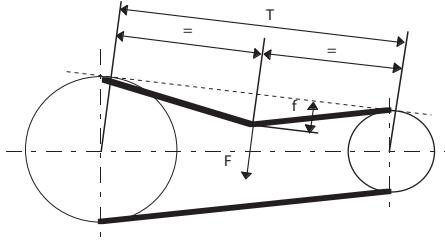

### Check belt tension

The belt tension must be checked again after a few hours according to the procedure in the diagram below;.

- Measure the free tract T.
- Use a dynamometer to apply a force F to a belt perpendicularly at half of T. This must be able to cause an arrow f of 1.5 mm for every 100 mm of T.
- Compare the value of F supplied by the dynamometer with the values of F' and F'' given in the table below:

- If  $F < F'$  the belt must be tensioned.

- If  $F > F''$  it must be loosened.

- Since there is rapid decrease of tension during the break-in period of new transmissions, the new belt will need to be tightened so that the force F to obtain the arrow f, is 1.3 times the value of F'' shown in the table. Belt tension is adjusted by acting on the motor slide screws

## FREQUENCY OF CONTROLS

The components installed must undergo the operations described in the following table with the indicated frequency. The frequency indicated is approximate (average): particularly for the filters, the dirtying of which can vary considerably according to function of the unit.

The intervals may be shorter for the fans in the case of continuous functioning.

COMPONENT	PHASE	TYPE OF CONTROL	INSTRUMENT	SCHEDULED TIME
Ventilating section	Check belt tension	Instrumental	Dynamometer	Every two months
Ventilating section	Check belt wear	Visual	//	Every two months
Ventilating section	Check installation of the pulleys	Visual	//	Every two months
Ventilating section	Check rotor cleanliness	Visual	//	Every two months
Ventilating section	Check bearings noise	Visual-Auditive	//	Every two months
Synthetic filters	Check dirtying	Visual	//	Every two months
Compact filters	Check dirtying	Visual	//	Every two months
Coils	Check pack cleanliness	Visual	//	Yearly
Coils	Check condensate tray cleanliness	Visual	//	Yearly

## Diagnosis and fault solving

PROBLEM	CAUSE	REMEDY
1. INSUFFICIENT AIR FLOW RATE	1. Blocked filters 2. Blocked coils	- Clean the filters - Clean the coils
3. NO AIR FLOW RATE	1. Power supply off 2. Electric motor burnt out	- Check for the presence of power - Replace the electric motor
4. ABNORMAL NOISE	1. Excessive flow rate 2. Fan bearings worn or defective 3. Foreign bodies on the fans' impellers	- Reduce the flow rate - Replace bearings - Clean the impellers
5. MOISTURE CARRYOVER	1. Drain-trap blocked 2. No drain-trap or incorrectly made	- Clean drain-trap - Correctly prepare a drain-trap as indicated in this manual
6. REQUIRED TEMPERATURE NOT ACHIEVED	1. Temperature of the inlet air on coil outside the envisaged limits 2. Air in the water coils 3. Insufficient water flow rate in the water coils 4. Insufficient coil inlet water temperature 5. Dirty coil unit surface	- Check the air temperature - Bleed the coils - Increase the water flow rate - Check the water temperature - Clean the surface of the pack

## Unit disposal

The components have been designed to guarantee continual operations. The duration of some main parts depends on the maintenance to which it has undergone. At the end of their useful life, the units must be disposed of in accordance with the current laws in force. If the unit is to be disposed of, the opera-

tion must be carried out by specialised personnel.

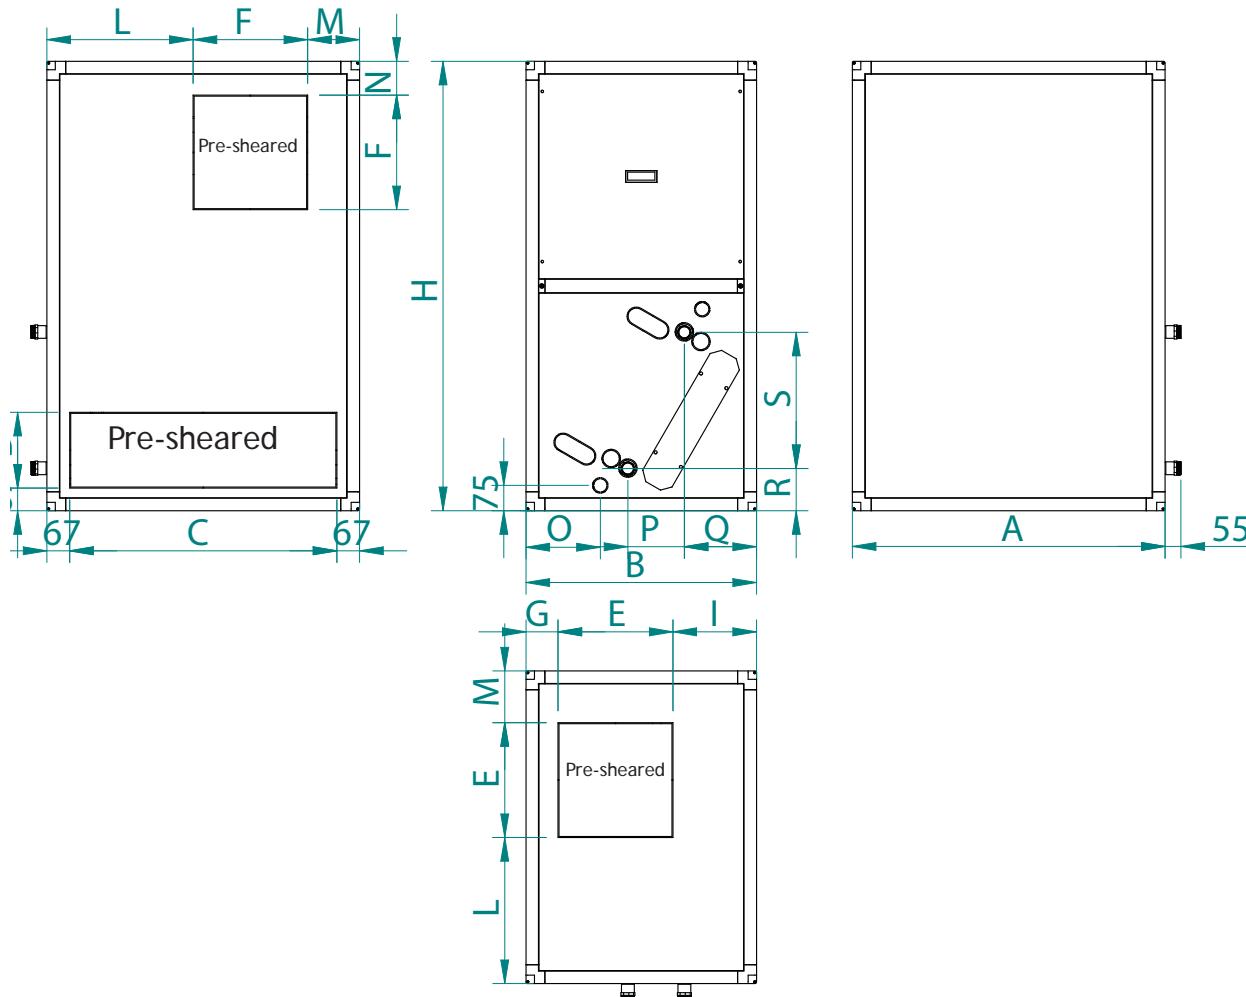

The main materials that make up the units are:

- galvanised steel and/or pre-coated sheet (panels, fans, condensate drip tray, internal metalwork);
- aluminium sheet or aluminium

alloy (coil fins, grilles, electric motor frame);

- copper (coil pipes, winding of the electric motors);
- polyurethane foam (sandwich panels insulation).
